

**850MHz, Low Distortion Current Feedback Operational Amplifiers**

The HFA1100, 1120 are a family of high-speed, wideband, fast settling current feedback amplifiers built with Intersil's proprietary complementary bipolar UHF-1 process. Both amplifiers operate with single supply voltages as low as 4.5V (see Application Information section).

The HFA1100 is a basic op amp with uncommitted pins 1, 5, and 8. The HFA1120 includes inverting input bias current adjust pins (pins 1 and 5) for adjusting the output offset voltage.

These devices offer a significant performance improvement over the AD811, AD9617/18, the CLC400-409, and the EL2070, EL2073, EL2030.

For Military grade product refer to the HFA1100/883, HFA1120/883 data sheet.

**Ordering Information**

PART NUMBER (BRAND)	TEMP. RANGE (°C)	PACKAGE	PKG. NO.
HFA1100IP	-40 to 85	8 Ld PDIP	E8.3
HFA1100IB (H1100I)	-40 to 85	8 Ld SOIC	M8.15
HFA1120IB (H1120I)	-40 to 85	8 Ld SOIC	M8.15
HFA11XXEVAL	DIP Evaluation Board for High-Speed Op Amps		

**The Op Amps with Fastest Edges**

**Features**

- Low Distortion (30MHz, HD2). . . . . -56dBc
- -3dB Bandwidth . . . . . 850MHz
- Very Fast Slew Rate. . . . . 2300V/μs
- Fast Settling Time (0.1%) . . . . . 11ns
- Excellent Gain Flatness
  - (100MHz) . . . . . ±0.14dB
  - (50MHz) . . . . . ±0.04dB
- High Output Current. . . . . 60mA
- Overdrive Recovery . . . . . <10ns
- Operates with 5V Single Supply (See AN9745)

**Applications**

- Video Switching and Routing
- Pulse and Video Amplifiers
- RF/IF Signal Processing
- Flash A/D Driver
- Medical Imaging Systems

## Application Information

### Optimum Feedback Resistor ( $R_F$ )

The enclosed plots of inverting and non-inverting frequency response detail the performance of the HFA1100/1120 in various gains. Although the bandwidth dependency on  $A_{CL}$  isn't as severe as that of a voltage feedback amplifier, there is an appreciable decrease in bandwidth at higher gains. This decrease can be minimized by taking advantage of the current feedback amplifier's unique relationship between bandwidth and  $R_F$ . All current feedback amplifiers require a feedback resistor, even for unity gain applications, and the  $R_F$ , in conjunction with the internal compensation capacitor, sets the dominant pole of the frequency response. Thus, the amplifier's bandwidth is inversely proportional to  $R_F$ . The HFA1100, 1120 designs are optimized for a 510 $\Omega$   $R_F$ , at a gain of +1. Decreasing  $R_F$  in a unity gain application decreases stability, resulting in excessive peaking and overshoot (Note: Capacitive feedback causes the same problems due to the feedback impedance decrease at higher frequencies). At higher gains the amplifier is more stable, so  $R_F$  can be decreased in a trade-off of stability for bandwidth. The table below lists recommended  $R_F$  values for various gains, and the expected bandwidth.

$A_{CL}$	$R_F$ ( $\Omega$ )	BW (MHz)
+1	510	850
-1	430	580
+2	360	670
+5	150	520
+10	180	240
+19	270	125

### Offset Adjustment

The HFA1120 allows for adjustment of the inverting input bias current to null the output offset voltage.  $-I_{BIAS}$  flows through  $R_F$ , so any change in bias current forces a corresponding change in output voltage. The amount of adjustment is a function of  $R_F$ . With  $R_F = 510\Omega$ , the typical adjust range is  $\pm 100mV$ . For offset adjustment connect a 10k $\Omega$  potentiometer between pins 1 and 5 with the wiper connected to  $V_-$ .

### 5V Single Supply Operation

These amplifiers will operate at single supply voltages down to 4.5V. The table below details the amplifier's performance with a single 5V supply. The dramatic supply current reduction at this operating condition (refer also to Figure 23) makes these op amps even better choices for low power 5V systems. Refer to Application Note AN9745 for further information.

PARAMETER	TYP
Input Common Mode Range	1V to 4V
-3dB BW ( $A_V = +2$ )	267MHz
Gain Flatness (to 50MHz, $A_V = +2$ )	0.05dB
Output Voltage ( $A_V = -1$ )	1.3V to 3.8V
Slew Rate ( $A_V = +2$ )	475V/ $\mu s$
0.1% Settling Time	17ns
Supply Current	5.5mA

### Use of Die in Hybrid Applications

These amplifiers are designed with compensation to negate the package parasitics that typically lead to instabilities. As a result, the use of die in hybrid applications results in overcompensated performance due to lower parasitic capacitances. Reducing  $R_F$  below the recommended values for packaged units will solve the problem. For  $A_V = +2$  the recommended starting point is 300 $\Omega$ , while unity gain applications should try 400 $\Omega$ .

### PC Board Layout

The frequency performance of these amplifiers depends a great deal on the amount of care taken in designing the PC board. **The use of low inductance components such as chip resistors and chip capacitors is strongly recommended, while a solid ground plane is a must!**

Attention should be given to decoupling the power supplies. A large value (10 $\mu F$ ) tantalum in parallel with a small value chip (0.1 $\mu F$ ) capacitor works well in most cases.

Terminated microstrip signal lines are recommended at the input and output of the device. Output capacitance, such as that resulting from an improperly terminated transmission line will degrade the frequency response of the amplifier and may cause oscillations. In most cases, the oscillation can be avoided by placing a resistor in series with the output.

Care must also be taken to minimize the capacitance to ground seen by the amplifier's inverting input. The larger this capacitance, the worse the gain peaking, resulting in pulse overshoot and possible instability. To this end, it is recommended that the ground plane be removed under traces connected to pin 2, and connections to pin 2 should be kept as short as possible.

An example of a good high frequency layout is the Evaluation Board shown below.

### Evaluation Board

An evaluation board is available for the HFA1100 (Part Number HFA11XXEVAL). Please contact your local sales office for information.

The layout and schematic of the board are shown below:

**Typical Performance Curves**  $V_{SUPPLY} = \pm 5V$ ,  $R_F = 510\Omega$ ,  $T_A = 25^\circ C$ ,  $R_L = 100\Omega$ , Unless Otherwise Specified
