

# HD74LS122 ● Retriggerable Monostable Multivibrators (with Clear)

This d-c triggered multivibrator features output pulse width control by three methods. The basic pulse time is programmed by selection of external resistance and capacitance values. The HD74LS122 has an internal timing resistor that allows the circuit to be used with only an external capacitor, if so desired. Once triggered, the basic pulse width may be extended by retriggering the gated low-level-active (A) or high-level-active (B) inputs or be reduced by use of the overriding clear. Fig. 1 illustrates pulse control by retriggering and early clear. This device is provided with enough Schmitt hysteresis to ensure jitter-free triggering from the B input with transition rates as slow as 0.1 mV/ns.

## TYPICAL APPLICATION DATA FOR HD74LS122

For pulse widths when  $C_{ext} \leq 1000\text{pF}$ , See Fig. 3.

The output pulse is primarily a function of the external capacitor and resistor. For  $C_{ext} > 1000\text{pF}$ , the output pulse width ( $t_w$ ) is defined as:  $t_w(\text{out}) = K \cdot R_{ext} \cdot C_{ext}$ ; See Fig. 4
