

TDA3651A/3653 Vertical Deflection

Product Specification

Linear Products

DESCRIPTION

The TDA3651A is a vertical deflection output circuit for drive of various deflection systems with deflector currents up to 2A peak-to-peak.

FEATURES

- Driver
- Output stage
- Thermal protection and output stage protection
- Flyback generator
- Voltage stabilizer

APPLICATIONS

- Video terminals
- Television

FUNCTIONAL DESCRIPTION

Output Stage and Protection Circuit

Pin 5 is the output pin. The supply for the output stage is fed to Pin 6 and the output stage ground is connected to Pin 4. The output transistors of the Class-B output stage can each deliver 1A maximum. The 'upper' power transistor is protected against short-circuit currents to ground, whereas during flyback, the 'lower' power transistor is protected against too high voltages which may occur during adjustments.

Moreover, the output transistors have been given extra solidity by means of special measures in the internal circuit layout.

A thermal protection circuit is incorporated to protect the IC against too high dissipation.

This circuit is 'active' at 175°C and then reduces the deflection current to such a value that the dissipation cannot increase.

Driver and Switching Circuit

Pin 1 is the input for the driver of the output stage. The signal at Pin 1 is also applied to Pin 3 which is the input of a switching circuit. When the flyback starts, this switching circuit rapidly turns off the lower output stage and so limits the turn-off dissipation. It also allows a quick start of the flyback generator. Pin 3 is connected externally to Pin 1, in order to allow for different applications in which Pin 3 is driven separate from Pin 1.

Flyback Generator

The capacitor at Pin 6 is charged to a maximum voltage, which is equal to the supply voltage V_{CC} (Pin 9), during scan.

When the flyback starts and the voltage at the output pin (Pin 5) exceeds the supply voltage (Pin 9), the flyback generator is activated. The V_{CC} is connected in series (via Pin 8) with the voltage across the capacitor.

The voltage at the supply pin (Pin 6) of the output stage will then be maximum twice V_{CC} . Lower voltages can be chosen by changing the value of the external resistor at Pin 8.

Voltage Stabilizer

The internal voltage stabilizer provides a stabilized supply of 6V for drive of the output stage, so the drive current of the output stage is not affected by supply voltage variations. The stabilized voltage is available at Pin 7.

A decoupling capacitor of 2.2 μ F can be connected to this pin.

APPLICATION INFORMATION The following application data are measured in a typical application as shown in Figures 3 and 4.

Deflection current (including 6% overscan) peak-to-peak value	$I_{S(P-P)}$ typ. 0.87A
Supply voltage	V_{B-4} typ. 26V
Total supply current	I_{TOT} typ. 148mA
Peak output voltage during flyback	$V_{S-4M} < 50V$
Saturation voltage to supply	typ. 2.0V $V_{S-6sat} < 2.5V$
Saturation voltage to ground	typ. 2.0V $V_{S-4sat} < 2.5V$
Flyback time	typ. 0.95ms $t_{fl} < 1.2ms$
Total power dissipation in IC	P_{TOT} typ. 2.5W
Operating ambient temperature	$T_A < 65^{\circ}C$
