74FR25900
9-Bit, 3-Port Latchable Datapath Multiplexer with 25Ω Output Series Resistors

General Description

The 74FR25900 is a data bus multiplexer routing any of three 9-bit ports to any other one of the three ports. Readback of data latched from any port onto itself is also possible. The 74FR25900 maintains separate control of all latch-enable, output enable and select inputs for maximum flexibility. PINV allows inversion of the data from the C_8 to A_8 or B_8 path. This is useful for control of the parity bit in systems diagnostics.

This device includes 25Ω resistors in series with A and B Port outputs. Resistors minimize undershoot and ringing which may damage or corrupt sensitive device inputs driven by these ports.

Features

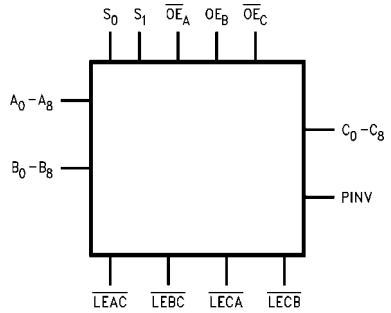
- 25Ω series resistors in the port A and B outputs eliminate the need for external resistors when driving MOS inputs such as DRAM arrays
- 9-bit data ports for systems carrying parity bits
- Readback capability for system self checks.
- Independent control lines for maximum flexibility
- Guaranteed multiple output switching and 250 pF load delays
- Outputs optimized for dynamic bus drive capability
- PINV parity control facilitates system diagnostics
- 74FR900 option available without output series resistors

Ordering Code:

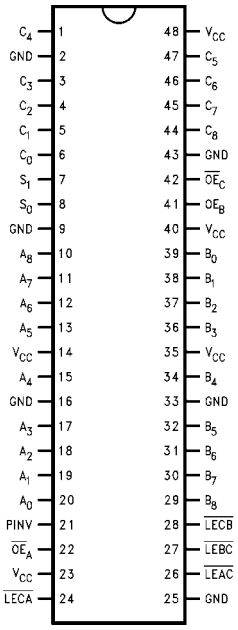
Order Number	Package Number	Package Description
74FR25900SSC	MS48A	48-Lead Small Shrink Outline Package (SSOP), JEDEC MO-118, 0.300 Wide

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

Logic Symbol



Connection Diagram



Pin Description

Pin Names	Description
$\overline{LExx}$	Latch Enable Inputs
$\overline{OE}_x$	Output Enable Inputs
PINV	Parity Invert Input
S_0, S_1	Select Inputs
A_0–A_8	Port A Inputs or 3-STATE Outputs
B_0–B_8	Port B Inputs or 3-STATE Outputs
C_0–C_8	Port C Inputs or 3-STATE Outputs

Functional Description

The 74FR25900 allows 9-bit data to be transferred from any of three 9-bit I/O ports to either of the two remaining I/O ports. The device employs latches in all paths for either transparent or synchronous operation. Readback capability from any port to itself is also possible.

Data transfer within the 74FR25900 is controlled through use of the select (S_0 and S_1) and output-enable ($\overline{OE}_A$, OE_B and $\overline{OE}_C$) inputs as described in Table 1. Additional control is available by use of the latch-enable inputs ($\overline{LEAC}$, $\overline{LECA}$, $\overline{LEBC}$, $\overline{LECB}$) allowing either synchronous or transparent transfers (see Table 2). Table 1 indicates several readback conditions. By latching data on a given port and initiating the readback control configuration, previous data may be read for system verification or diagnostics. This mode may be useful in implementing system diagnostics.

Data at the port to be readback must be latched prior to enabling the outputs on that port. If this is not done, a closed data loop will result causing possible data integrity problems. Note that the A and B Ports allow readback without affecting any other port. C Port, however, requires interruption of either A or B Ports to complete its readback path.

PINV controls inversion of the C_8 bit. A LOW on PINV allows C_8 data to pass unaltered. A HIGH causes inversion of the data. See Table 3. This feature allows forcing of parity errors for use in system diagnostics. This is particularly helpful in 486 processor designs as the 486 does not provide odd/even parity selection internally.

TABLE 1. Datapath Control

Inputs					Function
S_0	S_1	$\overline{OE}_A$	OE_B	$\overline{OE}_C$	
L	X	H	L	L	Port A to Port C
L	L	H	H	H	Port A to Port B
L	O	H	H	L	Port A to B+C
H	L	L	L	H	Port B to Port A
H	X	H	L	L	Port B to Port C
H	O	L	L	L	Port B to A+C
X	H	L	L	H	Port C to Port A
X	H	H	H	H	Port C to Port B
X	H	L	H	H	Port C to A+B
X	X	H	L	H	Outputs Disabled
L	L	L	X	X	(Readback to A) (Note 1)
L	H	L	X	L	(Readback to A or C) (Note 1)
H	L	X	H	X	(Readback to B) (Note 1)
H	H	X	H	L	(Readback to B or C) (Note 1)

Note 1: Readback operation in latched mode only. Transparent operation could result in unpredictable results.

TABLE 2. Latch-Enable Control

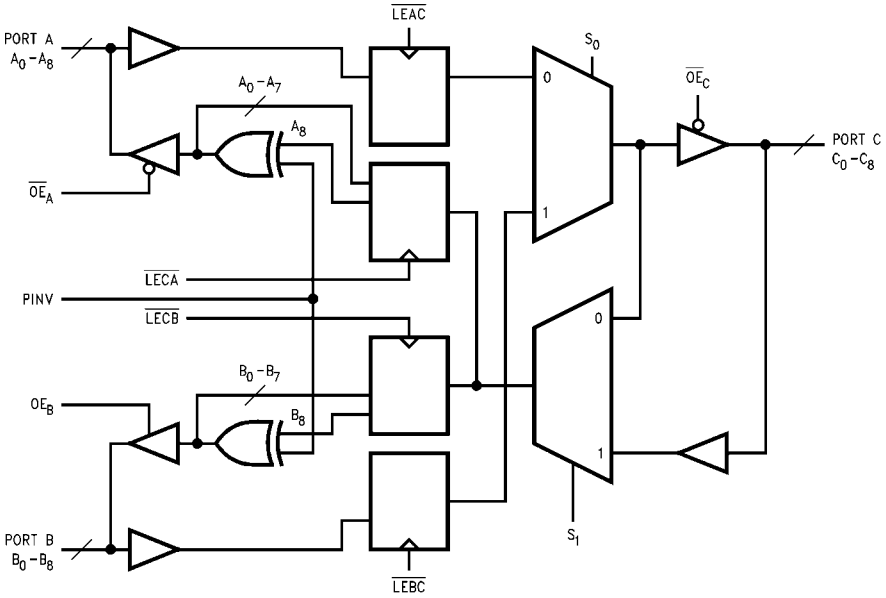
$\overline{LExx}$	Input	Output
L	L	L
L	H	H
H	X	Q_0

TABLE 3. PINV Control

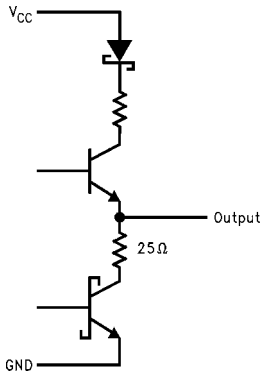
PINV	C_8	A_8 or B_8
L	L	L
L	H	H
H	L	H
H	H	L

Key:
L = LOW Voltage
H = HIGH Voltage Level
Q_0 = Output state prior to $\overline{LExx}$ LOW-to-HIGH transition

Logic Diagram



Schematic of A and B Port Outputs



Absolute Maximum Ratings(Note 2)

Storage Temperature	−65°C to +150°C
Ambient Temperature under Bias	−55°C to +125°C
Junction Temperature under Bias	−55°C to +150°C
V_{CC} Pin Potential to Ground Pin	−0.5V to +7.0V
Input Voltage (Note 3)	−0.5V to +7.0V
Input Current (Note 3)	−30 mA to +5.0 mA
Voltage Applied to Output	
in HIGH State (with V_{CC} = 0V)	
Standard Output	−0.5V to V_{CC}
3-STATE Output	−0.5V to +5.5V
Current Applied to Output	
in LOW State (Max)	twice the rated I_{OL} (mA)
ESD Last Passing Voltage (Min)	2000V

Recommended Operating Conditions

Free Air Ambient Temperature	0°C to +70°C
Supply Voltage	+4.5V to +5.5V

Note 2: Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 3: Either voltage limit or current limit is sufficient to protect inputs.

DC Electrical Characteristics

Symbol	Parameter	Min	Typ	Max	Units	V_{CC}	Conditions
V_{IH}	Input HIGH Voltage	2.0			V		Recognized HIGH Signal
V_{IL}	Input LOW Voltage			0.8	V		Recognized LOW Signal
V_{CD}	Input Clamp Diode Voltage			−1.2	V	Min	I_{IN} = −18 mA
V_{OH}	Output HIGH Voltage	2.4			V	Min	I_{OH} = −3 mA (A_n, B_n, C_n)
		2.0			V	Min	I_{OH} = −15 mA (A_n, B_n, C_n)
V_{OL}	Output LOW Voltage			0.50	V	Min	I_{OL} = 1 mA (A_n, B_n)
				0.75	V	Min	I_{OL} = 12 mA (A_n, B_n)
				0.50	V	Min	I_{OL} = 24 mA (C_n)
I_{IH}	Input HIGH Current			5	µA	Max	V_{IN} = 2.7V (Control Inputs)
I_{BVI}	Input HIGH Current Breakdown Test			7	µA	Max	V_{IN} = 7.0V (Control Inputs)
I_{BVIT}	Input High Current Breakdown Test (I/O)			100	µA	Max	V_{IN} = 5.5V (A_n, B_n, C_n)
I_{IL}	Input Low Current			−150	µA	Max	V_{IN} = 0.5V (Control Inputs)
V_{ID}	Input Leakage Test	4.75			V	0.0	I_{ID} = 1.9 µA, All Other Pins Grounded
I_{OD}	Output Circuit Leakage Test			3.75	V	0.0	V_{IOD} = 150 mV, All Other Pins Grounded
$I_{IH} + I_{OZH}$	Output Leakage Current			25	µA	Max	V_{OUT} =2.7V (A_n, B_n, C_n)
$I_{IIL} + I_{OZL}$	Output Leakage Current			−150	µA	Max	V_{OUT} = 0.5V (A_n, B_n, C_n)
I_{OS}	Output Short Circuit Current	−100		−225	mA	Max	V_{OUT} = 0.0V (A_n, B_n, C_n)
I_{CEX}	Output HIGH Leakage Current			50	µA	Max	V_{OUT} = V_{CC} (A_n, B_n, C_n)
I_{ZZ}	Bus Drainage Test			100	µA	0.0	V_{OUT} = 5.25V (A_n, B_n, C_n)
I_{CCH}	Power Supply Current		115	150	mA	Max	All Outputs HIGH (Note 4)
I_{CCL}	Power Supply Current		170	200	mA	Max	All Outputs LOW (Note 4)
I_{CCZ}	Power Supply Current		147	175	mA	Max	Outputs in 3-STATE

Note 4: 2 ports active only

t_{PHZ} t_{PLZ}	Output Disable Time A_n, B_n	1.5	7.0			ns

Note 5: This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase, i.e., all LOW-to-HIGH, HIGH-to-LOW, 3-STATE-to-HIGH, etc.

Note 6: This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors standard AC load. This specification pertains to single output switching only.

Physical Dimensions inches (millimeters) unless otherwise noted

Package Number MS48A

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
