

GM6535

60 MHz Universal Programmable Dual PLL Frequency synthesizer

GENERAL DESCRIPTIONS

The GM6535 is a dual phase – locked loop (PLL) frequency synthesizer especially designed for CT-1 cordless phone applications worldwide. This frequency synthesizer is also for any products with frequency operation at 60 MHz or below.

The device features fully programmable receive, transmit, reference, and auxiliary reference counters accessed through an MCU serial interface, this feature allows this device to operate in any CT-1 cordless phone application.

The device consists of two independent phase detectors for transmit and receive loops. A common reference oscillator, driving two independent reference frequency counters, provides independent reference frequencies for transmit and receive loops.

The auxiliary reference counter allows the user to select an additional reference frequency for receive and transmit loops if required.

PIN CONFIGURATION

ABSOLUTE MAXIMUM RATINGS (Voltages Referenced to v_{SS})

| Symbol | Rating | Value | Unit |
|-------------------|--|----------------------|-------------|
| V_{DD} | DC Supply Voltage | -0.5 to +6.0 | V |
| V_{in} | Input Voltage, all Inputs | -0.5 to $V_{DD}+0.5$ | V |
| I_{in}, I_{out} | DC Current Drain Per Pin | 10 | mA |
| I_{DD}, I_{SS} | DC Current Drain V_{DD} or V_{SS} Pins | 30 | mA |
| T_{stg} | Storage Temperature Range | -65 to +150 | $^{\circ}C$ |

FEATURES

- Operating Voltage Range: 2.5 to 5.5 V
- Operating Temperature Range: -40 to +75 $^{\circ}C$
- Operating Power Consumption: 3.0mA @ 2.5V
- Maximum Operating Frequency: 60MHz @ 200mV_{p-p}, $V_{DD}=2.5V$
- 3 or 4 Pins Used for serial MCU Interface
- Power Saving Mode Controlled by MCU
- Lock Detect Signal
- On-Chip Reference Oscillator Supports External Crystals to 16.0 MHz
- Reference Frequency Counter Division Range: 16 to 4095
- Auxiliary Reference Frequency Counter Division Range: 16 to 16,383
- Transmit Counter Division Range: 16 to 65,535
- Receive Counter Division Range: 16 to 65,535

ELECTRICAL CHARACTERISTICS (Voltages Referenced to V_{SS} , $T_A=25$ °C)

| Symbol | Characteristic | V_{DD} | Guaranteed Limit | | Unit | |
|-----------------------|--|---|------------------|-------|------|----|
| | | | Min | Max | | |
| V_{DD} | Power Supply Voltage | - | 2.5 | 5.5 | | |
| V_{OL} | Output Voltage ($I_{out} = 0$) | 0 Level | 2.5 | - | 0.1 | V |
| | | | 5.5 | - | 0.1 | |
| V_{OH} | (V _{in} =V _{DD} or 0) | 1 Level | 2.5 | 2.45 | - | V |
| | | | 5.5 | 5.45 | - | |
| V_{IL} | Input Voltage (V _{out} 0.5 V or V _{DD} - 0.5V) | 0 Level | 2.5 | - | 0.75 | V |
| | | | 5.5 | - | 1.65 | |
| V_{IH} | | 1 Level | 2.5 | 1.75 | - | V |
| | | | 5.5 | 3.85 | - | |

SWITCHING WAVEFORMS

Figure 4. ENB High During Serial Transfer

Figure 5. ENB Low During Serial Transfer

PIN DESCRIPTIONS

OSC_{in}/OSC_{out}

Reference Oscillator Input/Output (Pins8, 7)

These pins form a reference oscillator when connected to an external parallel-resonant crystal frequencies and reference frequencies for cordless phone applications in various countries. OSC_{in} may also serve as input for an externally generated reference signal which is typically ac coupled.

AD_{in}, D_{in}, CLK, ENB

Auxiliary Data In, Data In, Clock, Enable (Pins2, 3, 1, 4)

These four pins provide an MCU serial interface for programming the reference counter, the transmit-channel counter, and the receive-channel counter. They also provide various controls of the PLL including the power saving mode and the programming format.

TxPS/f_{Tx}, RxPS/f_{Rx}

Transmit Power Save, Receive Power Save (Pins 13, 11)

For a normal application, these output pins provide the status of the internal power saving mode operation. If the transmit channels counter circuitry is in power down mode, TxPS/f_{Tx} outputs a high state. If the receive-channels counter circuitry is in power down mode, RxPS/f_{Rx} is set high. These output can be applied for controlling the external power switch for the transmitter and the receiver to save MCU control pins. In the Tx/Rx channel counter test mode, the TxPS/f_{Tx} and RxPS/f_{Rx} pins output the divided value of the transmit channel counter (f_{Tx}) and the receive channel counter (f_{Rx}), respectively. This test mode operation is controlled by the control register. Details of the counter test mode are in the Tx/Rx Channel Counter Test section of this data sheet.

| Crystal | $\div N$ Value | f_{R1} $\div 4$ | f_{R2} $\div 25$ |
|------------|----------------|-------------------|--------------------|
| 11.150 MHz | 446 | 6.25 MHz | 1.0 MHz |
| 11.150 MHz | 223 | 12.5 MHz | |
| 10.240 MHz | 512 | 5.0 MHz | |
| 12.000 MHz | 600 | 5.0 MHz | |

Figure 6. Reference Frequencies for Cordless Phone Applications of Various Countries

f_{in-T}/f_{in-R}

Transmit/Receive Counter Inputs (Pins14, 9)

f_{in-T} and f_{in-R} are inputs to the transmit and the receive counters, respectively. These signals are typically driven from the loop VCO and ac-coupled. The minimum input signal level is 200mV_{p-p} @ 60.0MHz.

TxPD_{out}/RxPD_{out}

Transmit/Receive Phase detector Outputs (Pins15, 10)

These are three-state outputs of the transmit and receive phase detectors for use as loop error signals (see Figure7 for phase detector output waveforms).

Frequency $f_v > f_R$ or f_v leading: output=negative pulse.
 Frequency $f_v < f_R$ or f_v lagging: output = positive pulse.
 Frequency $f_v = f_R$ and phase coincidence: output = high impedance state.

f_R is the divided-down reference frequency at the phase detector input and f_v is the divided-down VCO frequency at the phase detector input.

LD Lock Detect (Pin16)

The lock detect signal is associated with the transmit loop. The output at a high level indicates an out-of-lock condition (see Figure 7 for the LD output waveform).

V_{DD} Positive Power Supply (Pin 12)

V_{DD} is the most positive power supply potential ranging from 2.5 to 5.5V with respect to VSS.

V_{SS} Negative Power Supply (Pin 6)

V_{SS} is the most negative supply potential and is usually connected to ground.

V_H = High voltage level

V_L = Low voltage level

*At this point, when both f_R and f_V are in phase, the output is forced to near mid supply.

NOTE: The TxPD_{out} and RxPD_{out} generates error pulses during out-of-lock conditions.

When locked in phase and frequency, the output is high impedance and the voltage at that pin is determined by the low-pass filter capacitor

Figure 7. Phase Detector/Lock Detector Output Waveforms

MCU PROGRAMMING SCHEME

The MCU programming scheme is defined in two formats controlled by the ENB input. If the enable signal is high during the serial data transfer, control register/reference frequency programming is selected. If the ENB is low, programming of the transmit and receive counters is selected. During programming of the transmit and receive counters, both AD_{in} and D_{in} pins can input the data to the transmit and receive counters. Both counters data is clocked into the PLL internal shift register at the leading edge of the CLK signal. It is not necessary to reprogram the reference frequency counter/control register when using the enable signal to program the transmit/receive channels.

In programming the control register/reference frequency scheme, the most significant bit (MSB) of the programming word identifies whether the input data is the control word. If the MSB is 1, the input data is the control word (Figure 8). Also see figure NO TAG and Table 1 for control register and bit function. If the MSB is 0, the input data is the reference frequency (Figure 9).

The reference frequency data word is 32-bit word containing the 12-bit reference frequency data, the 14-bit auxiliary reference frequency counter information, the reference frequency selection plus, the auxiliary reference frequency counter enable bit(Figure 9).

If the AUX REF ENB bit is high, the 14-bit auxiliary reference frequency counter provides an additional phase reference frequency output for the

loops. If AUX REF ENB bit is low, the auxiliary reference frequency counter is forced into power-down modes for current saving. (other power down modes are also provided through the control register per Table 2 and Figure 8). At the falling edge of the ENB signal, the data is stored in the registers.

There are two interfacing schemes for the universal channel mode: the three-pin and four-pin interfacing schemes. The three-pin interfacing scheme is suited for use with the MCU SPI (serial peripheral interface) (Figure 10), while the four-pin interfacing scheme is commonly used for general I/O port connection (Figure 11).

For the three-pin interfacing scheme, the auxiliary data select bit is set to 0. All 32 bits of data, which define both the 16-bit transmit counter and the 16-bit receive counter, latch into the PLL internal register though the data in pins at the leading edge of CLK. See Figure 12 and 13.

For the four-pin interfacing scheme, the auxiliary data select bit is set to 1. In this scheme, the 16-bit transmit counter's data enters into the AD_{in} pin at the same time as the 16-bit receive. This simultaneous entry of the transmit and receive counters causes the programming period of the four-pin scheme to be half that of the three-pin scheme (see Figures 14 and 15).

While programming Tx/Rx Channel Counter, the ENB pin must be pulsed to provide falling edge to latch the shifted data after the rising edge of the last clock. Maximum data transfer rate is 500 kbps.

NOTE: ENB must be high during the serial transfer.

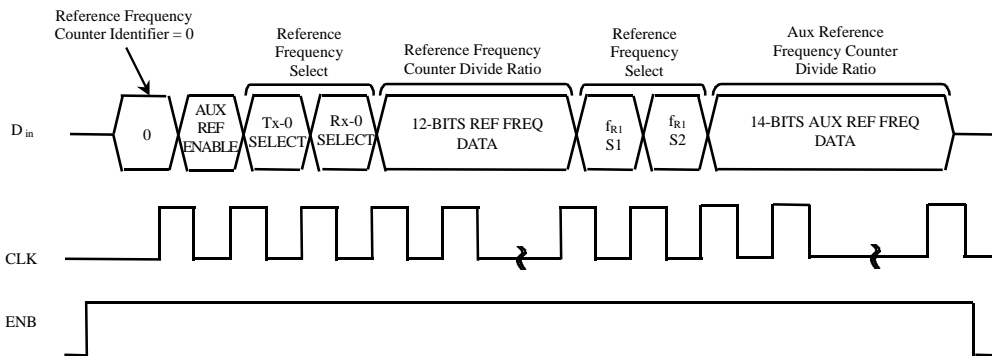

Figure 8. Programming Format of the control Register

Table 1. Control Register Function Bits Description

| | |
|--------------------------|--|
| Test Bit | Set to 1 for Tx/Rx channel counter test mode Set to 0 for normal application |
| Aux Data Select | Set to 1 for both ADin and Din pins inputting the transmit 16-bits data and receive 16-bits data respectively Set to 0 for normal application interfacing with MCU serial peripheral interface. Does not use AD _{in} pin; tie AD _{in} to V _{SS} . |
| REF _{out} ÷3/÷4 | If set to 1, REF _{out} output frequency is equal to OSC _{out} ÷3. If set to 0, REF _{out} output is OSC _{out} ÷4. |
| TxPD Enable | If set to 1, the transmit counter, transmit phase detector, and the associated circuitry is in power-down mode. TxPS/f _{Tx} is set "High". |
| RxPD Enable | If set to 1, the receive counter, receive phase detector, and the associated circuitry is in power-down mode. RxPS/f _{Tx} is set "High". |
| Ref PD Enable | If set to 1, both 12-bit and 14-bit reference frequency counters are in power-down mode |

Table 2. Control Register Power Down Bits Function

| TxPD Enable | RxPD Enable | REF PD Enable | Tx-Channel Counter | Rx-channel Counter | Reference Frequency Counter |

Table 3. Global CT-1 Reference frequency Setting vs Channel Frequencies

| Country | Channel Frequency | f_{R1} | f_{R2} |
|-------------|-----------------------------|-------------------|----------|
| U.S.A | 46/49MHz(10,15,25 Channels) | 5.0 KHz | - |
| France | 26/41 MHz | 6.25 KHz/12.5 KHz | - |
| Spain | 31/41 MHz | 5.0 KHz | - |
| Australia | 30/39 MHz | 5.0 KHz | - |
| U.K | 1.7/47 MHz | 6.25 KHz | 1.0 KHz |
| New Zealand | 1.7/34/40 MHz | 6.25 KHz | 1.0 KHz |

REFERENCE FREQUENCY SELECTION AND PROGRAMMING

Figure 16 shows the bit function of the reference frequency programming word. The user can either select the fixed reference frequency for all channels accordingly or provide a specific reference frequency for a particular channel by using two reference frequency counters (e.g., for an application in France, the base set transmit channel common fixed reference frequency is 6.25 KHz or 12.5 KHz). (See Table 3 Figure 6 for reference frequencies for various countries.)

However, transmit channels 6, 8, and 14 can be set to 25 KHz, and channel 8 reference frequency can be set to 50 KHz. But this reference frequency may not be applied to the receiving side; therefore, the receiving side reference frequency must be generated by another reference frequency counter. The higher the reference frequency, the better the phase noise performance and faster the lock time, but the PLL consumes more current if both reference frequency counters are in operation. In general, the 12-bit reference frequency counter plus the $\div 4$ and $\div 25$ module can offer all the reference

frequencies for global CT-1 transmit and receive channel requirements. Users can select their own reference frequency by introducing the additional 14-bit auxiliary reference frequency counter.

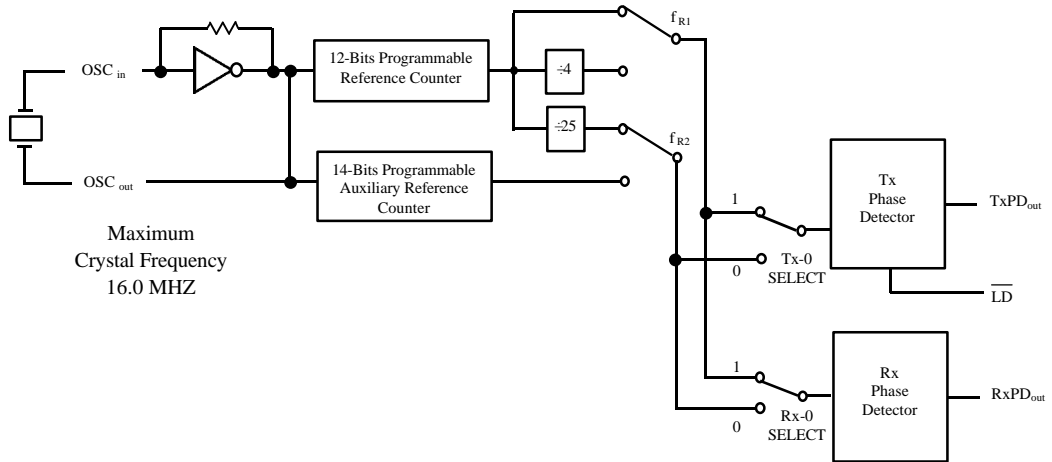

Again, the 14-bit auxiliary reference frequency counter can be shut down by the auxiliary reference enable bit in the reference counter programming word by setting the bit to 0. At this state, the f_{R2} is automatically connected to point C (the $\div 25$ block output), and f_{R1} can be connected to point A or B by setting the f_{R1-S1} and f_{R1-S2} bits in the reference counter program word. The 14-bit auxiliary reference frequency counter data will be in Don't Care state.

If the 14-bit auxiliary reference frequency counter is enabled (auxiliary reference enable = 1), the f_{R2} is automatically connected to point D (14-bit counter output), and f_{R1} can be selected to connect to point A, B, or C, depending on the bit setting of f_{R1-S1} and f_{R1-S2} .

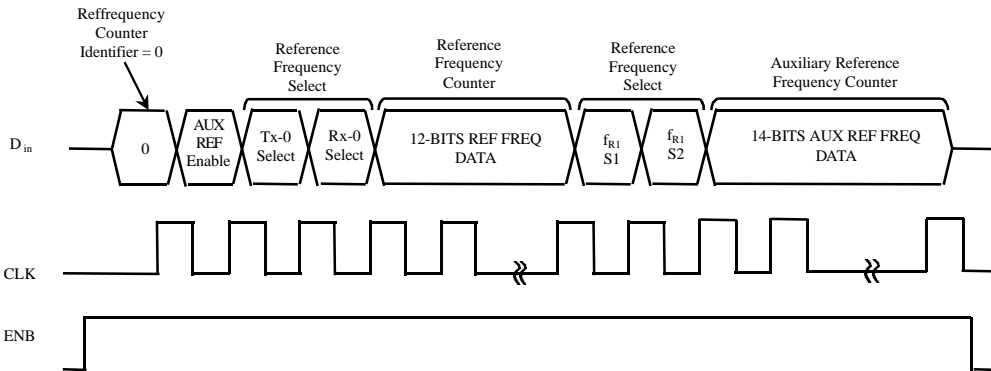

Table 4 and Figure 16 describe the functions of the auxiliary reference enable bit and the f_{R1-S1} and f_{R1-S2} bits selection.

Table 4. Bit Function and the Reference Frequency Selection Bit Setting of the Reference Frequency Counter Programming Word

| AUX REF Enable | Auxiliary Reference Frequency Counter Mode | Module Select | N/A Not Applicable | | |
|----------------|--|------------------------|--------------------|-------------|------------------------|
| | | | f_{R1-S1} | f_{R1-S2} | f_{R1} Routing |
| 0 | 14-Bit Auxiliary Reference Frequency Counter Disable | $f_{R2} \rightarrow C$ | 0 | 0 | N/A |
| | | | 0 | 1 | $f_{R1} \rightarrow A$ |
| | | | 1 | 0 | $f_{R1} \rightarrow B$ |
| | | | 1 | 1 | N/A |
| 1 | 14-Bit Auxiliary Reference Frequency Counter Disable | $f_{R2} \rightarrow D$ | 0 | 0 | N/A |
| | | | 0 | 1 | $f_{R1} \rightarrow A$ |
| | | | 1 | 0 | $f_{R1} \rightarrow B$ |
| | | | 1 | 1 | $f_{R1} \rightarrow C$ |

NOTE: ENB must be high during the serial transfer.

Figure 16. Reference Frequency Counter/selection Programming Mode

POWER SAVING OPERATION

This PLL has a programmable power-saving scheme. The transmit counter, receive counter and the reference frequency counter can be powered down individually by setting the TxPD enable, RxPD enable and Ref PD enable bits of the control register. The functions of the power down control bits are explained in Table 2 and the programming format is in Figure 8.

The output pins TxPS/f_{Tx} and RxPS/f_{Rx} output the

status of the internal power saving setting. If the bit TxPD enable is set high (transmit counter is set to power-down mode), then the TxPS/f_{Tx} pin will also output a high state. This TxPS/f_{Tx} output can control an external power switch to switch off the transmitter, as shown in Figure 17. This scheme can be applied to the RxPS/f_{Rx} output to control the receiver power saving operation as required.

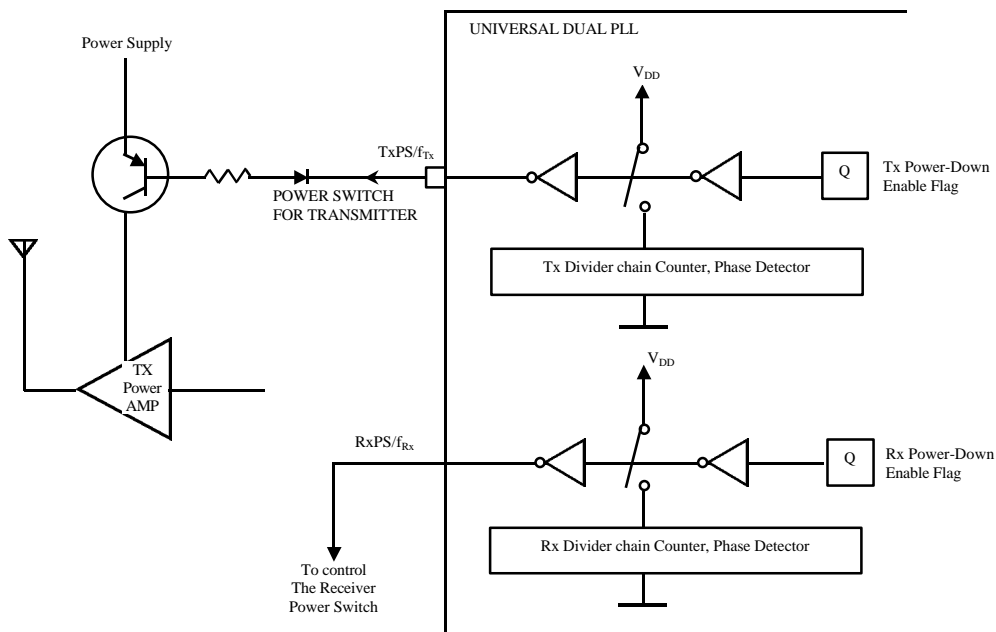

Figure 17. TxPS/f_{Tx} and RxPS/f_{Rx} Outputs to Control Power Switches of the Transmitter and Receiver

TX/RX CHANNEL COUNTER TEST

In normal applications, the $TxPS/f_{Tx}$ and the $RxPS/f_{Rx}$ output pins indicate the power saving mode status. However, the user can examine the Tx and Rx channel counter outputs by setting the Test bit in the control register to 1. The final value of the transmit-channel counter and the receive-

channel counter multiplex out to $TxPS/f_{Tx}$ and $RxPS/f_{Rx}$ respectively. The user can verify the divided-down output waveform associated with the RF input level in the PLL circuitry implementation (Figure 18).

LittleDiode supplies new, hard to find or obsolete electronic components and semiconductors all over the world.

With over two million different components listed you are sure to find the part you need.

Feel free to visit us today at our online store:

LittleDiode.com

Looking forward to providing you with the best possible service.
