

### FEATURES

- Automatically Senses Sample Frequencies
- No Programming Required
- Attenuates Sample Clock Jitter
- 3.3 V–5 V Input and 3.3 V Core Supply Voltages
- Accepts 16-/18-/20-/24-Bit Data
- Up to 192 kHz Sample Rate
- Input/Output Sample Ratios from 7.75:1 to 1:8
- Bypass Mode
- Multiple AD1895 TDM Daisy-Chain Mode
- 128 dB Signal-to-Noise and Dynamic Range (A-Weighted, 20 Hz–20 kHz BW)
- Up to –122 dB THD + N
- Linear Phase FIR Filter
- Hardware Controllable Soft Mute
- Supports  $256 \times f_s$ ,  $512 \times f_s$  or  $768 \times f_s$  Master Mode Clock
- Flexible Three-Wire Serial Data Port with Left-Justified, I<sup>2</sup>S, Right-Justified (16-, 18-, 20-, 24-Bits), and TDM Serial Port Modes
- Master/Slave Input and Output Modes
- 28-Lead SSOP Plastic Package

### APPLICATIONS

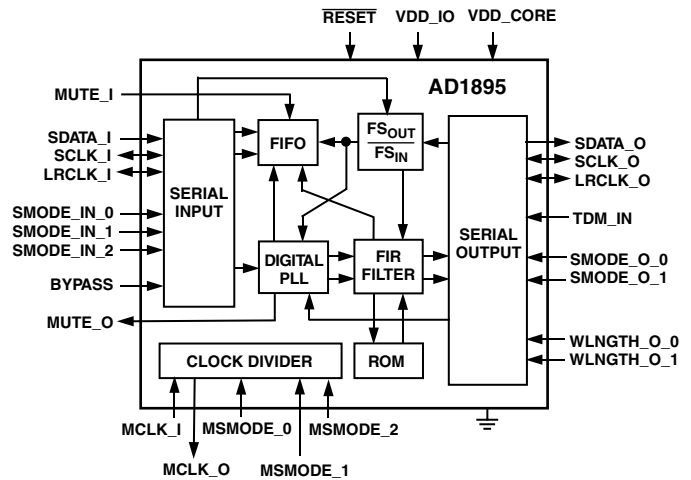

- Home Theater Systems, Automotive Audio Systems, DVD, DVD-R, CD-R, Set-Top Boxes, Digital Audio Effects Processors

### PRODUCT OVERVIEW

The AD1895 is a 24-bit, high-performance, single-chip, second-generation asynchronous sample rate converter. Based upon Analog Devices, Inc. experience with its first asynchronous sample rate converter, the AD1890, the AD1895 offers improved performance and additional features. This improved performance includes a THD + N range of –115 dB to –122 dB depending on sample rate and input frequency, 128 dB (A-Weighted) dynamic range, 192 kHz sampling frequencies for both input and output sample rates, improved jitter rejection, and 1:8 upsampling and 7.75:1 downsampling ratios. Additional features include more serial formats, a bypass mode, and better interfacing to digital signal processors.

The AD1895 has a 3-wire interface for the serial input and output ports that supports left-justified, I<sup>2</sup>S, and right-justified (16-, 18-, 20-, 24-bit) modes. Additionally, the serial output port supports TDM mode for daisy chaining multiple AD1895s to

### FUNCTIONAL BLOCK DIAGRAM

a digital signal processor. The serial output data is dithered down to 20, 18 or 16 bits when 20-, 18- or 16-bit output data is selected. The AD1895 sample rate converts the data from the serial input port to the sample rate of the serial output port. The sample rate at the serial input port can be asynchronous with respect to the output sample rate of the output serial port. The master clock to the AD1895, MCLK, can be asynchronous to both the serial input and output ports.

MCLK can either be generated off-chip or on-chip by the AD1895 master clock oscillator. Since MCLK can be asynchronous to the input or output serial ports, a crystal can be used to generate MCLK internally to reduce noise and EMI emissions on the board. When MCLK is synchronous to either the output or input serial port, the AD1895 can be configured in a master mode where MCLK is divided down and used to generate the left/right and bit clocks for the serial port that is synchronous to MCLK. The AD1895 supports master modes of  $256 \times f_s$ ,  $512 \times f_s$ , and  $768 \times f_s$  for both input and output serial ports.

Conceptually, the AD1895 interpolates the serial input data by a rate of  $2^{20}$  and samples the interpolated data stream by the output sample rate. In practice, a 64-tap FIR filter with  $2^{20}$  polyphases, a FIFO, a digital servo loop that measures the time difference between input and output samples within 5 ps, and a digital circuit to track the sample rate ratio are used to perform the interpolation and output sampling. Refer to the Theory of Operation section. The digital servo loop and sample rate ratio circuit automatically track the input and output sample rates.

### NOTES

<sup>1</sup>Lower sampling rates than given by this formula are possible, but the jitter rejection will decrease.

<sup>2</sup>Refer to the Typical Performance Characteristics section for DNR and THD+N numbers over wide range of Input and Output Sample Rates.

<sup>3</sup>For any other ratio, minimum THD+N will be better than -115 dB. Please refer to detailed performance plots.

| Power Supplies                  |            |              |      |
| VDD_CORE                        | -0.3       | +3.6         | V    |
| VDD_IO                          | -0.3       | +6.0         | V    |
| Digital Inputs                  |            |              |      |
| Input Current                   |            | ±10          | mA   |
| Input Voltage                   | DGND - 0.3 | VDD_IO + 0.3 | V    |
| Ambient Temperature (Operating) | -40        | +105         | °C   |

\*Stresses greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**ORDERING GUIDE**

| Model       | Temperature Range | Package Description | Package Option    |
|-------------|-------------------|---------------------|-------------------|
| AD1895YRS   | -40°C to +105°C   | 28-Lead SSOP        | RS-28             |
| AD1895YRSRL | -40°C to +105°C   | 28-Lead SSOP        | RS-28 on 13" Reel |

**CAUTION**

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD1895 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high-energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

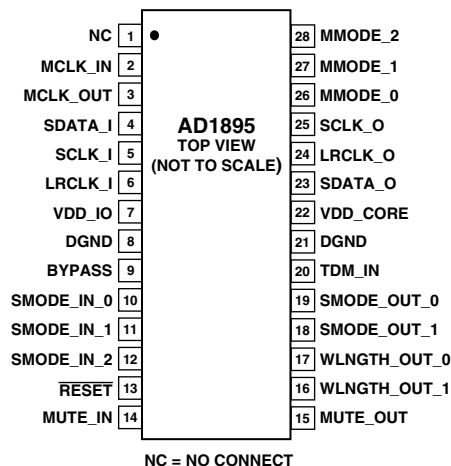

## PIN FUNCTION DESCRIPTIONS

| Pin No. | IN/OUT | Mnemonic    | Description   |
|---------|--------|-------------|---|
| 1       | IN     | NC          | No Connect  |
| 2       | IN     | MCLK_IN     | Master Clock or Crystal Input   |
| 3       | OUT    | MCLK_OUT    | Master Clock Output or Crystal Output                                 |
| 4       | IN     | SDATA_I     | Input Serial Data (at Input Sample Rate)                              |
| 5       | IN/OUT | SCLK_I      | Master/Slave Input Serial Bit Clock                                   |
| 6       | IN/OUT | LRCLK_I     | Master/Slave Input Left/Right Clock                                   |
| 7       | IN     | VDD_IO      | 3.3 V/5 V Input/Output Digital Supply Pin                             |
| 8       | IN     | DGND        | Digital Ground Pin  |
| 9       | IN     | BYPASS      | ASRC Bypass Mode, Active High   |
| 10      | IN     | SMODE_IN_0  | Input Port Serial Interface Mode Select Pin 0                         |
| 11      | IN     | SMODE_IN_1  | Input Port Serial Interface Mode Select Pin 1                         |
| 12      | IN     | SMODE_IN_2  | Input Port Serial Interface Mode Select Pin 2                         |
| 13      | IN     | RESET       | Reset Pin, Active Low   |
| 14      | IN     | MUTE_IN     | Mute Input Pin— Active HI Normally Connected to MUTE_OUT              |
| 15      | OUT    | MUTE_OUT    | Output Mute Control – Active HI                                       |
| 16      | IN     | WLNTH_OUT_1 | Hardware Selectable Output Wordlength—Select Pin 1                    |
| 17      | IN     | WLNTH_OUT_0 | Hardware Selectable Output Wordlength—Select Pin 0                    |
| 18      | IN     | SMODE_OUT_1 | Output Port Serial Interface Mode Select Pin 1                        |
| 19      | IN     | SMODE_OUT_0 | Output Port Serial Interface Mode Select Pin 0                        |
| 20      | IN     | TDM_IN      | Serial Data Input* (Only for Daisy-Chain Mode). Ground when not used. |
| 21      | IN     | DGND        | Digital Ground Pin  |
| 22      | IN     | VDD_CORE    | 3.3 V Digital Supply Pin  |
| 23      | OUT    | SDATA_O     | Output Serial Data (at Output Sample Rate)                            |
| 24      | IN/OUT | LRCLK_O     | Master/Slave Output Left/Right Clock                                  |
| 25      | IN/OUT | SCLK_O      | Master/Slave Output Serial Bit Clock                                  |
| 26      | IN     | MMODE_0     | Master/Slave Clock Ratio Mode Select Pin 0                            |
| 27      | IN     | MMODE_1     | Master/Slave Clock Ratio Mode Select Pin 1                            |
| 28      | IN     | MMODE_2     | Master/Slave Clock Ratio Mode Select Pin 2                            |

\*Also used to input matched-phase mode data.

(Continued from page 1)

The digital servo loop measures the time difference between input and output sample rates within 5 ps. This is necessary in order to select the correct polyphase filter coefficient. The digital servo loop has excellent jitter rejection for both input and output sample rates as well as the master clock. The jitter rejection begins at less than 1 Hz. This requires a long settling time whenever  $\overline{\text{RESET}}$  is deasserted or when the input or output sample rate changes. To reduce the settling time, upon deassertion of  $\overline{\text{RESET}}$  or a change in a sample rate, the digital servo loop enters the fast settling mode. When the digital servo loop has adequately settled in the fast mode, it switches into the normal or slow settling mode and continues to settle until the time difference measurement between input and output sample rates is within 5 ps. During fast mode, the MUTE\_OUT signal

is asserted high. Normally, the MUTE\_OUT is connected to the MUTE\_IN pin. The MUTE\_IN signal is used to softly mute the AD1895 upon assertion and softly unmute the AD1895 when it is deasserted.

The sample rate converter of the AD1895 can be bypassed altogether using the bypass mode. In bypass mode, the AD1895's serial input data is directly passed to the serial output port without any dithering. This is useful for passing through nonaudio data or when the input and output sample rates are synchronous to one another and the sample rate ratio is exactly 1 to 1.

The AD1895 is a 3.3 V, 5 V input tolerant part and is available in a 28-lead SSOP SMD package. The AD1895 is 5 V input-tolerant only when the VDD\_IO supply pin is supplied with 5 V.

## ASRC FUNCTIONAL OVERVIEW

### THEORY OF OPERATION

Asynchronous sample rate conversion is converting data from one clock source at some sample rate to another clock source at the same or different sample rate. The simplest approach to asynchronous sample rate conversion is the use of a zero-order hold between two samplers shown in Figure 4. In an asynchronous system T2 is never equal to T1 nor is the ratio between T2 and T1 rational. As a result, samples at  $f_{S\_OUT}$  will be repeated or dropped producing an error in the resampling process. The frequency domain shows the wide side lobes that result from this error when the sampling of  $f_{S\_OUT}$  is convolved with the attenuated images from the  $\sin(x)/x$  nature of the zero-order hold. The images at  $f_{S\_IN}$ , dc signal images, of the zero-order hold are infinitely attenuated. Since the ratio of T2 to T1 is an irrational number, the error resulting from the resampling at  $f_{S\_OUT}$  can never be eliminated. However, the error can be significantly reduced through interpolation of the input data at  $f_{S\_IN}$ . The AD1895 is conceptually interpolated by a factor of  $2^{20}$ .

Figure 4. Zero-Order Hold Being Used by  $f_{S\_OUT}$  to Resample Data from  $f_{S\_IN}$

### THE CONCEPTUAL HIGH INTERPOLATION MODEL

Interpolation of the input data by a factor of  $2^{20}$  involves placing  $(2^{20} - 1)$  samples between each  $f_{S\_IN}$  sample. Figure 5 shows both the time domain and the frequency domain of interpolation by a factor of  $2^{20}$ . Conceptually, interpolation by  $2^{20}$  would involve the steps of zero-stuffing  $(2^{20} - 1)$  number of samples

between each  $f_{S\_IN}$  sample and convolving this interpolated signal with a digital low-pass filter to suppress the images. In the time domain it can be seen that  $f_{S\_OUT}$  selects the closest  $f_{S\_IN} \times 2^{20}$  sample from the zero-order hold as opposed to the nearest  $f_{S\_IN}$  sample in the case of no interpolation. This significantly reduces the resampling error.

Figure 5. Time Domain of the Interpolation and Resampling

In the frequency domain shown in Figure 6 the interpolation expands the frequency axis of the zero-order hold. The images from the interpolation can be sufficiently attenuated by a good low-pass filter. The images from the zero-order hold are now pushed by a factor of  $2^{20}$  closer to the infinite attenuation point of the zero-order hold, which is  $f_{S\_IN} \times 2^{20}$ . The images at the zero-order hold are the determining factor for the fidelity of the output at  $f_{S\_OUT}$ . The worst-case images can be computed from the zero-order hold frequency response, maximum image =  $\sin(\pi \times F/f_{S\_INTERP}) / (\pi \times F/f_{S\_INTERP})$ . F is the frequency of the worst-case image which would be  $2^{20} \times f_{S\_IN} \pm f_{S\_IN}/2$ , and  $f_{S\_INTERP}$  is  $f_{S\_IN} \times 2^{20}$ .

The following worst-case images would appear for  $f_{S\_IN} = 192$  kHz:

$$\text{Image at } f_{S\_INTERP} - 96 \text{ kHz} = -125.1 \text{ dB}$$

$$\text{Image at } f_{S\_INTERP} + 96 \text{ kHz} = -125.1 \text{ dB}$$

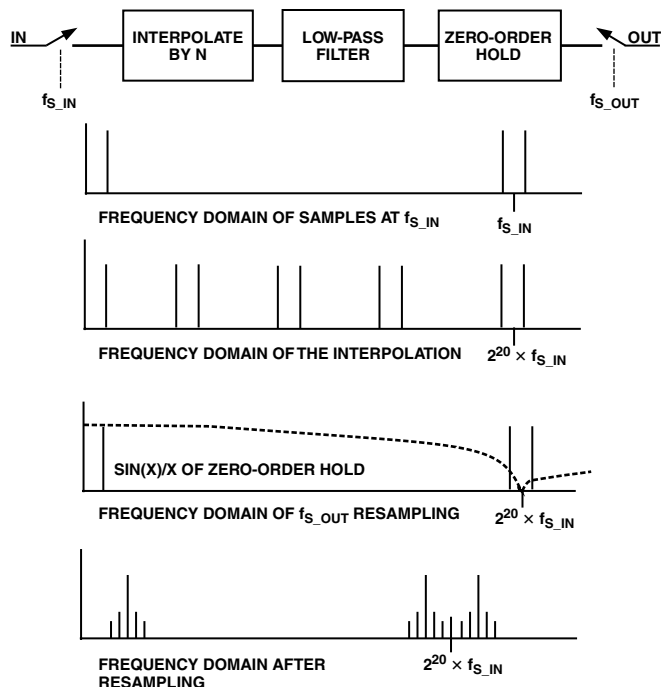

Figure 6. Frequency Domain of the Interpolation and Resampling

#### HARDWARE MODEL

The output rate of the low-pass filter of Figure 5 would be the interpolation rate,  $2^{20} \times 192000 \text{ kHz} = 201.3 \text{ GHz}$ . Sampling at a rate of 201.3 GHz is clearly impractical, not to mention the number of taps required to calculate each interpolated sample. However, since interpolation by  $2^{20}$  involves zero-stuffing  $2^{20}-1$  samples between each  $f_{S\_IN}$  sample, most of the multiplies in the low-pass FIR filter are by zero. A further reduction can be realized by the fact that since only one interpolated sample is taken at the output at the  $f_{S\_OUT}$  rate, only one convolution needs to be performed per  $f_{S\_OUT}$  period instead of  $2^{20}$  convolutions. A 64-tap FIR filter for each  $f_{S\_OUT}$  sample is sufficient to suppress the images caused by the interpolation.

The difficulty with the above approach is that the correct interpolated sample needs to be selected upon the arrival of  $f_{S\_OUT}$ . Since there are  $2^{20}$  possible convolutions per  $f_{S\_OUT}$  period, the arrival of the  $f_{S\_OUT}$  clock must be measured with an accuracy of  $1/201.3 \text{ GHz} = 4.96 \text{ ps}$ . Measuring the  $f_{S\_OUT}$  period with a clock of 201.3 GHz frequency is clearly impossible; instead, several coarse measurements of the  $f_{S\_OUT}$  clock period are made and averaged over time.

Another difficulty with the above approach is the number of coefficients required. Since there are  $2^{20}$  possible convolutions with a 64-tap FIR filter, there need to be  $2^{20}$  polyphase coefficients for each tap, which requires a total of  $2^{26}$  coefficients. To reduce the number of coefficients in ROM, the AD1895 stores a small subset of coefficients and performs a high-order interpolation between the stored coefficients. So far the above approach works for the case of  $f_{S\_OUT} > f_{S\_IN}$ . However, in the case when the output sample rate,  $f_{S\_OUT}$ , is less than the input sample

rate,  $f_{S\_IN}$ , the ROM starting address, input data and the length of the convolution must be scaled. As the input sample rate rises over the output sample rate, the antialiasing filter's cutoff frequency has to be lowered because the Nyquist frequency of the output samples is less than the Nyquist frequency of the input samples. To move the cutoff frequency of the antialiasing filter, the coefficients are dynamically altered and the length of the convolution is increased by a factor of  $(f_{S\_IN}/f_{S\_OUT})$ . This technique is supported by the Fourier transform property that if  $f(t)$  is  $F(\omega)$ , then  $f(k \times t)$  is  $F(\omega/k)$ . Thus, the range of decimation is simply limited by the size of the RAM.

#### THE SAMPLE RATE CONVERTER ARCHITECTURE

The architecture of the sample rate converter is shown in Figure 7. The sample rate converter's FIFO block adjusts the left and right input samples and stores them for the FIR filter's convolution cycle. The  $f_{S\_IN}$  counter provides the write address to the FIFO block and the ramp input to the digital servo loop. The ROM stores the coefficients for the FIR filter convolution and performs a high-order interpolation between the stored coefficients. The sample rate ratio block measures the sample rate for dynamically altering the ROM coefficients and scaling of the FIR filter length as well as the input data. The digital servo loop automatically tracks the  $f_{S\_IN}$  and  $f_{S\_OUT}$  sample rates and provides the RAM and ROM start addresses for the start of the FIR filter convolution.

Figure 7. Architecture of the Sample Rate Converter

The FIFO receives the left and right input data and adjusts the amplitude of the data for both the soft muting of the sample rate converter and the scaling of the input data by the sample rate ratio before storing the samples in the RAM. The input data is scaled by the sample rate ratio because as the FIR filter length of the convolution increases, so does the amplitude of the convolution output. To keep the output of the FIR filter from saturating, the input data is scaled down by multiplying it by  $(f_{S\_OUT}/f_{S\_IN})$  when  $f_{S\_OUT} < f_{S\_IN}$ . The FIFO also scales the input data for muting and unmuting of the AD1895.

The RAM in the FIFO is 512 words deep for both left and right channels. A small offset of 16 is added to the write address provided by the  $f_{S\_IN}$  counter to prevent the RAM read pointer from ever overlapping the write address. The maximum decimation rate can be calculated from the RAM word depth as  $(512-16)/64 \text{ taps} = 7.75$  and a small offset.

Figure 8. Frequency Response of the Digital Servo Loop.  $f_{S\_IN}$  is the X-Axis,  $f_{S\_OUT} = 192$  kHz, Master Clock Frequency Is 30 MHz

The digital servo loop is essentially a ramp filter that provides the initial pointer to the address in RAM and ROM for the start of the FIR convolution. The RAM pointer is the integer output of the ramp filter while the ROM is the fractional part. The digital servo loop must be able to provide excellent rejection of jitter on the  $f_{S\_IN}$  and  $f_{S\_OUT}$  clocks as well as measure the arrival of the  $f_{S\_OUT}$  clock within 4.97 ps. The digital servo loop will also divide the fractional part of the ramp output by the ratio of  $f_{S\_IN}/f_{S\_OUT}$  for the case when  $f_{S\_IN} > f_{S\_OUT}$ , to dynamically alter the ROM coefficients.

The digital servo loop is implemented with a multirate filter. To settle the digital servo loop filter quicker upon start-up or a change in the sample rate, a “fast mode” was added to the filter. When the digital servo loop starts up or the sample rate is changed, the digital servo loop kicks into “fast mode” to adjust and settle on the new sample rate. Upon sensing the digital servo loop settling down to some reasonable value, the digital servo loop will kick into “normal” or “slow mode.” During “fast mode” the MUTE\_OUT signal of the sample rate converter is asserted to let the user know that they should mute the sample rate converter to avoid any clicks or pops. The frequency response of the digital servo loop for “fast mode” and “slow mode” are shown in Figure 8.

The FIR filter is a 64-tap filter in the case of  $f_{S\_OUT} \geq f_{S\_IN}$  and is  $(f_{S\_IN}/f_{S\_OUT}) \times 64$  taps for the case when  $f_{S\_IN} > f_{S\_OUT}$ . The FIR filter performs its convolution by loading in the starting address of the RAM address pointer and the ROM address pointer from the digital servo loop at the start of the  $f_{S\_OUT}$  period. The FIR filter then steps through the RAM by decrementing its address by 1 for each tap, and the ROM pointer increments its address by the  $(f_{S\_OUT}/f_{S\_IN}) \times 2^{20}$  ratio for  $f_{S\_IN} > f_{S\_OUT}$  or  $2^{20}$  for  $f_{S\_OUT} \geq f_{S\_IN}$ . Once the ROM address rolls over, the convolution is completed. The convolution is performed for both the left and right channels, and the multiply accumulate circuit used for the convolution is shared between the channels.

The  $f_{S\_IN}/f_{S\_OUT}$  sample rate ratio circuit is used to dynamically alter the coefficients in the ROM for the case when  $f_{S\_IN} > f_{S\_OUT}$ . The ratio is calculated by comparing the output of an  $f_{S\_OUT}$  counter to the output of an  $f_{S\_IN}$  counter. If  $f_{S\_OUT} > f_{S\_IN}$ , the ratio is held at one. If  $f_{S\_IN} > f_{S\_OUT}$ , the sample rate ratio is updated if it is different by more than two  $f_{S\_OUT}$  periods from the previous  $f_{S\_OUT}$  to  $f_{S\_IN}$  comparison. This is done to provide some hysteresis to prevent the filter length from oscillating and causing distortion.

## OPERATING FEATURES

### RESET and Power Down

When  $\overline{\text{RESET}}$  is asserted low, the AD1895 will turn off the master clock input to the AD1895, MCLK\_I, initialize all of its internal registers to their default values, and three-state all of the I/O pins. While  $\overline{\text{RESET}}$  is active low, the AD1895 is consuming minimum power. For the lowest possible power consumption while  $\overline{\text{RESET}}$  is active low, all of the input pins to the AD1895 should be static.

When  $\overline{\text{RESET}}$  is deasserted, the AD1895 begins its initialization routine where all locations in the FIFO are initialized to zero, MUTE\_OUT is asserted high, and any I/O pins configured as outputs are enabled. The mute control counter, which controls the soft mute attenuation of the input samples, is initialized to maximum attenuation, -127 dB (see Mute Control section).

When asserting  $\overline{\text{RESET}}$  and deasserting  $\overline{\text{RESET}}$ , the  $\overline{\text{RESET}}$  should be held low for a minimum of 5 MCLK\_I cycles. During power-up the  $\overline{\text{RESET}}$  should be held low until the power supplies have stabilized.

### Power Supply and Voltage Reference

The AD1895 is designed for three-volt operation with five-volt input tolerance on the input pins. VDD\_CORE is the three-volt supply that is used to power the core logic of the AD1895 and to drive the output pins. VDD\_IO is used to set the input voltage tolerance of the input pins. In order for the input pins to be five-volt input tolerant, VDD\_IO must be connected to a five-volt supply. If the input pins do not have to be five-volt input tolerant, then VDD\_IO can be connected to VDD\_CORE. VDD\_IO should never be less than VDD\_CORE. VDD\_CORE and VDD\_IO should be bypassed with 100 nF ceramic chip capacitors, as close to the pins as possible, to minimize power supply and ground bounce caused by inductance in the traces. A bulk aluminium electrolytic capacitor of 47  $\mu\text{F}$  should also be provided on the same PC board as the AD1895.

### Digital Filter Group Delay

The filter group delay is given by the equation:

$$GD = \frac{16}{f_{S\_IN}} + \frac{32}{f_{S\_IN}} \text{seconds for } f_{S\_OUT} > f_{S\_IN}$$

$$GD = \frac{16}{f_{S\_IN}} + \left( \frac{32}{f_{S\_IN}} \right) \times \left( \frac{f_{S\_IN}}{f_{S\_OUT}} \right) \text{seconds for } f_{S\_OUT} < f_{S\_IN}$$

### Mute Control

When the MUTE\_IN pin is asserted high, the MUTE\_IN control will perform a soft mute by linearly decreasing the input data to the AD1895 FIFO to almost zero, -127 dB attenuation. When MUTE\_IN is deasserted low, the MUTE\_IN control will linearly decrease the attenuation of the input data to 0 dB. A 12-bit counter, clocked by LRCLK\_I is used to control the mute attenuation. Therefore, the time it will take from the assertion of MUTE\_IN to -127 dB full mute attenuation is  $4096/\text{LRCLK\_I}$  seconds. Likewise, the time it will take to reach 0 dB mute attenuation from the deassertion of MUTE\_IN is  $4096/\text{LRCLK\_I}$  seconds.

Upon  $\overline{\text{RESET}}$ , or a change in the sample rate between LRCLK\_I and LRCLK\_O, the MUTE\_OUT pin will be asserted high. The MUTE\_OUT pin will remain asserted high until the digital servo loop's internal fast settling mode has completed. When the digital servo loop has switched to slow settling mode, the MUTE\_OUT pin will deassert. While MUTE\_OUT is asserted, the MUTE\_IN pin should be asserted as well to prevent any major distortion in the audio output samples.

### Master Clock

A digital clock connected to the MCLK\_I pin or a fundamental or third overtone crystal connected between MCLK\_I and MCLK\_O can be used to generate the master clock, MCLK\_I. The MCLK\_I pin can be five-volt input-tolerant just like any of the other AD1895 input pins. A fundamental mode crystal can be inserted between MCLK\_I and MCLK\_O for master clock frequency generation up to 27 MHz. For master clock frequency generation with a crystal beyond 27 MHz it is recommended that the user use a third overtone crystal and to add an LC filter at the output of MCLK\_O to filter out the fundamental, do not notch filter the fundamental. Please refer to your quartz crystal supplier for values for external capacitors and inductor components.

Figure 9a. Fundamental-Mode Circuit Configuration

Figure 9b. Third-Overtone Circuit Configuration

There are, of course, maximum and minimum operating frequencies for the AD1895 master clock. The maximum master clock frequency at which the AD1895 is guaranteed to operate is 30 MHz. 30 MHz is more than sufficient to sample rate convert sampling frequencies of 192 kHz + 12%. The minimum required frequency for the master clock generation for the AD1895 depends upon the input and output sample rates. The master clock has to be at least 138 times greater than the maximum input or output sample rate.

# AD1895

## Serial Data Ports—Data Format

The serial data input port mode is set by the logic levels on the SMODE\_IN\_0/1/2 pins. The serial data input port modes available are Left Justified, I<sup>2</sup>S and Right Justified (RJ), 16, 18, 20, or 24 bits as defined in Table I.

**Table I. Serial Data Input Port Mode**

| SMODE_IN_[0:2] |   |   | Interface Format         |
|----------------|---|---|--------------------------|
| 2              | 1 | 0 |                          |
| 0              | 0 | 0 | Left Justified           |
| 0              | 0 | 1 | I <sup>2</sup> S         |
| 0              | 1 | 0 | Undefined                |
| 0              | 1 | 1 | Undefined                |
| 1              | 0 | 0 | Right Justified, 16 Bits |
| 1              | 0 | 1 | Right Justified, 18 Bits |
| 1              | 1 | 0 | Right Justified, 20 Bits |
| 1              | 1 | 1 | Right Justified, 24 Bits |

The serial data output port mode is set by the logic levels on the SMODE\_OUT\_0/1 and WLNTH\_OUT\_0/1 pins. The serial mode can be changed to Left Justified, I<sup>2</sup>S, Right Justified or TDM as defined in the following table. The output word width can be set by using the WLNTH\_OUT\_0/1 pins as shown in the Word Width table. When the output word width is less than

24 bits, dither is added to the truncated bits. The Right Justified serial data out mode assumes 64 SCLK\_O cycles per frame, divided evenly for left and right.

**Table II. Serial Data Output Port Mode**

| SMODE_OUT_[0:2] |   | Interface Format     |
|-----------------|---|----------------------|
| 1               | 0 |                      |
| 0               | 0 | Left Justified (LJ)  |
| 0               | 1 | I <sup>2</sup> S     |
| 1               | 0 | TDM Mode             |
| 1               | 1 | Right Justified (RJ) |

**Table III. Word Width**

| WLNTH_OUT_[0:1] |   | Word Width |
|-----------------|---|------------|
| 1               | 0 |            |
| 0               | 0 | 24 Bits    |
| 0               | 1 | 20 Bits    |
| 1               | 0 | 18 Bits    |
| 1               | 1 | 16 Bits    |

The following timing diagrams show the serial mode formats.

**Figure 10. Input/Output Serial Data Formats**

## TDM MODE APPLICATION

In TDM mode, several AD1895s can be daisy-chained together and connected to the serial input port of a SHARC® DSP. The AD1895 contains a 64-bit parallel load shift register. When the LRCLK\_O pulse arrives, each AD1895 parallel loads its left and right data into the 64-bit shift register. The input to the shift register is connected to TDM\_IN while the output is connected to SDATA\_O. By connecting the SDATA\_O to the TDM\_IN

of the next AD1895, a large shift register is created which is clocked by SCLK\_O.

The number of AD1895s that can be daisy-chained together is limited by the maximum frequency of SCLK\_O, which is about 25 MHz. For example, if the output sample rate,  $f_s$ , is 48 kHz, up to eight AD1895s could be connected since  $512 \times f_s$  is less than 25 MHz. In Master/TDM Mode, the number of AD1895s that can be daisy-chained is fixed to four.

# AD1895

## Serial Data Port Master Clock Modes

Either of the AD1895 serial ports can be configured as a master serial data port. However, only one serial port can be a master while the other has to be a slave. In master mode, the AD1895 requires a  $256 \times f_S$ ,  $512 f_S$  or  $768 \times f_S$  master clock (MCLK\_I). For a maximum master clock frequency of 30 MHz, the maximum sample rate is limited to 96 kHz. In slave mode, sample rates up to 192 kHz can be handled.

When either of the serial ports is operated in master mode, the master clock is divided down to derive the associated left/right subframe clock (LRCLK) and serial bit clock (SCLK). The master clock frequency can be selected for 256, 512, or 768 times the input or output sample rate. Both the input and output serial ports will support master mode LRCLK and SCLK generation for all serial modes, Left Justified, I<sup>2</sup>S, Right Justified, and TDM for the output serial port.

## Bypass Mode

When the BYPASS pin is asserted high, the input data bypasses the sample rate converter and is sent directly to the serial output port. Dithering of the output data when the word length is set to less than 24 bits is disabled. This mode is ideal when the input and output sample rates are the same and LRCLK\_I and LRCLK\_O are synchronous with respect to each other. This mode can also be used for passing through non-AUDIO data since no processing is performed on the input data in this mode.

**Table IV. Serial Data Port Clock Modes**

| MMODE_0/1/2 |   |   | Interface Format  |
|-------------|---|---|---|
| 2           | 1 | 0 |   |
| 0           | 0 | 0 | Both Serial Ports are in Slave Mode                       |
| 0           | 0 | 1 | Output Serial Port is Master with $768 \times f_{S\_OUT}$ |
| 0           | 1 | 0 | Output Serial Port is Master with $512 \times f_{S\_OUT}$ |
| 0           | 1 | 1 | Output Serial Port is Master with $256 \times f_{S\_OUT}$ |
| 1           | 0 | 0 | Undefined   |
| 1           | 0 | 1 | Input Serial Port is Master with $768 \times f_{S\_IN}$   |
| 1           | 1 | 0 | Input Serial Port is Master with $512 \times f_{S\_IN}$   |
| 1           | 1 | 1 | Input Serial Port is Master with $256 \times f_{S\_IN}$   |
