TIMING WAVEFORM OF READ CYCLE NO. 1⁽¹⁾

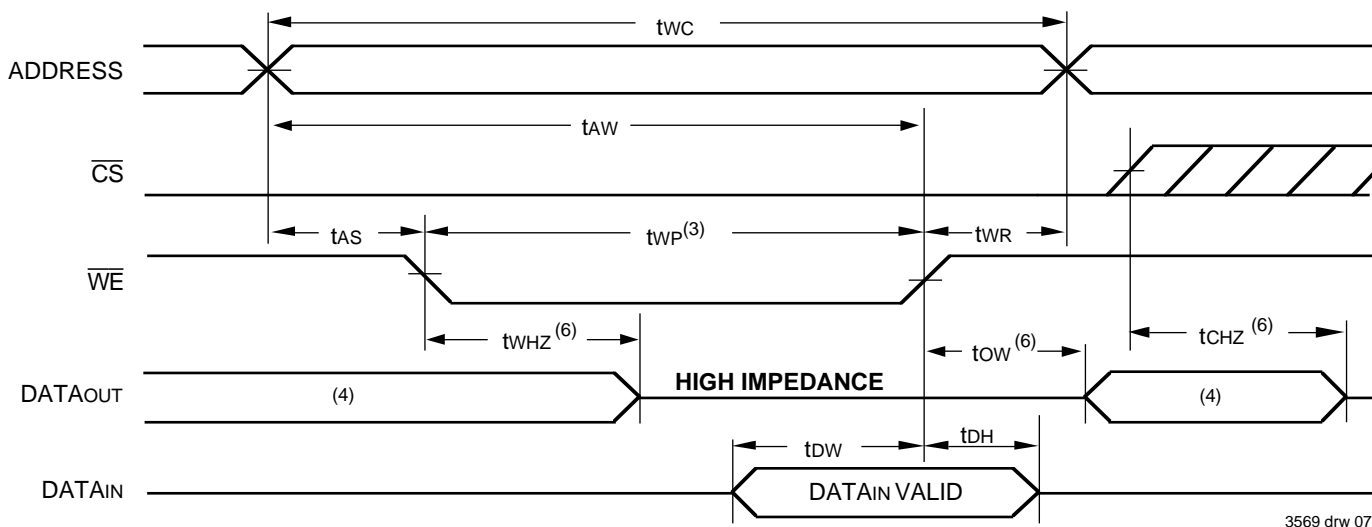

TIMING WAVEFORM OF READ CYCLE NO. 2^(1,2,4)

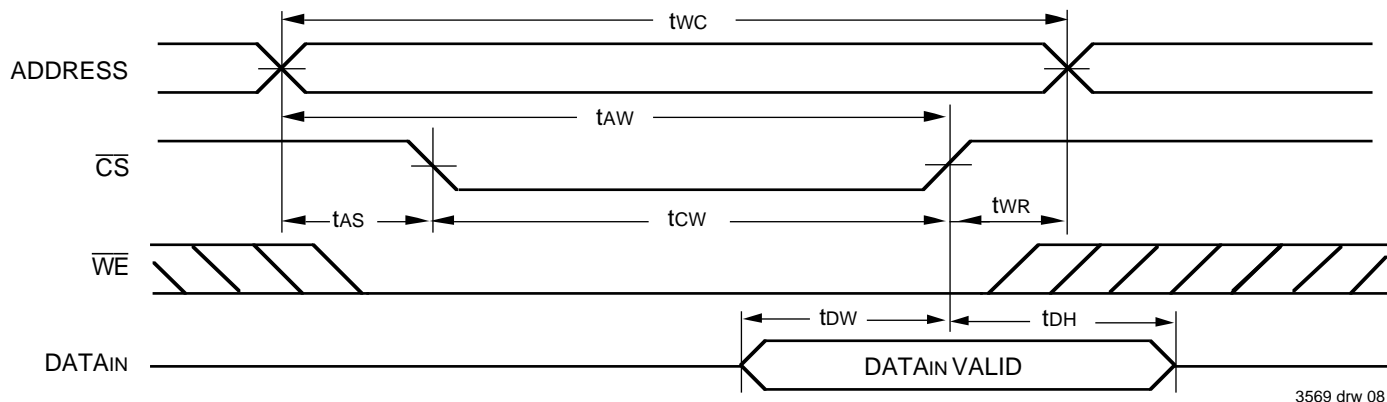

NOTES:

1. \overline{WE} is HIGH for Read Cycle.
2. Device is continuously selected, \overline{CS} is LOW.
3. Address must be valid prior to or coincident with the later of \overline{CS} transition LOW; otherwise t_{AA} is the limiting parameter.
4. \overline{OE} is LOW.
5. Transition is measured $\pm 200\text{mV}$ from steady state.

TIMING WAVEFORM OF WRITE CYCLE NO.1 (\overline{WE} CONTROLLED TIMING)^(1,2,3,5)

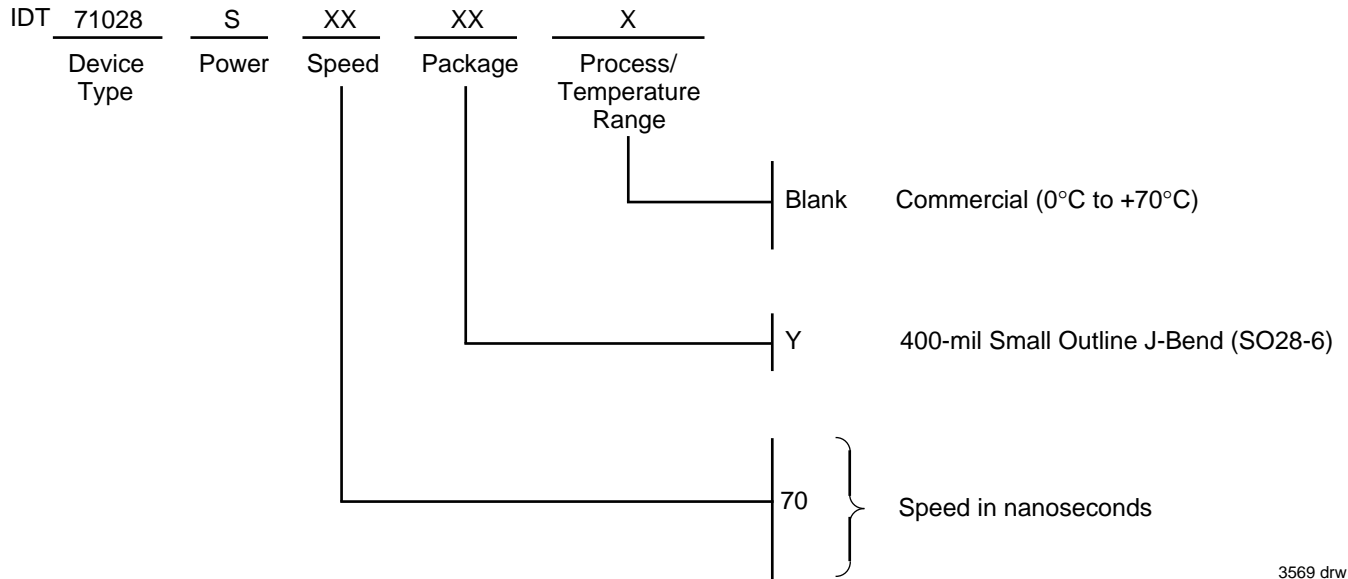

TIMING WAVEFORM OF WRITE CYCLE NO.2 (\overline{CS} CONTROLLED TIMING)^(1,2,5)

NOTES:

1. \overline{WE} or \overline{CS} must be HIGH during all address transitions.
2. A write occurs during the overlap of a LOW \overline{CS} and a LOW \overline{WE} .
3. \overline{OE} is continuously HIGH. If during a \overline{WE} controlled write cycle \overline{OE} is LOW, t_{WP} must be greater than or equal to $t_{WHZ} + t_{OW}$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{DW} . If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the minimum write pulse is as short as the specified t_{WP} .
4. During this period, I/O pins are in the output state, and input signals must not be applied.
5. If the \overline{CS} LOW transition occurs simultaneously with or after the \overline{WE} LOW transition, the outputs remain in a high-impedance state.
6. Transition is measured $\pm 200\text{mV}$ from steady state.
