TIMING WAVEFORM OF READ CYCLE NO. 1⁽¹⁾

TIMING WAVEFORM OF READ CYCLE NO. 2^(1, 2, 4)

NOTES:

1. \overline{WE} is HIGH for Read Cycle.
2. Device is continuously selected, $\overline{CS1}$ is LOW, CS2 is HIGH.
3. Address must be valid prior to or coincident with the later of $\overline{CS1}$ transition LOW and CS2 transition HIGH; otherwise t_{AA} is the limiting parameter.
4. OE is LOW.
5. Transition is measured $\pm 200\text{mV}$ from steady state.

TIMING WAVEFORM OF WRITE CYCLE NO. 1 (\overline{WE} CONTROLLED TIMING)^(1, 2, 5, 7)

3568 drw 07

TIMING WAVEFORM OF WRITE CYCLE NO. 2 ($\overline{CS1}$ AND CS2 CONTROLLED TIMING)^(1, 2, 5)

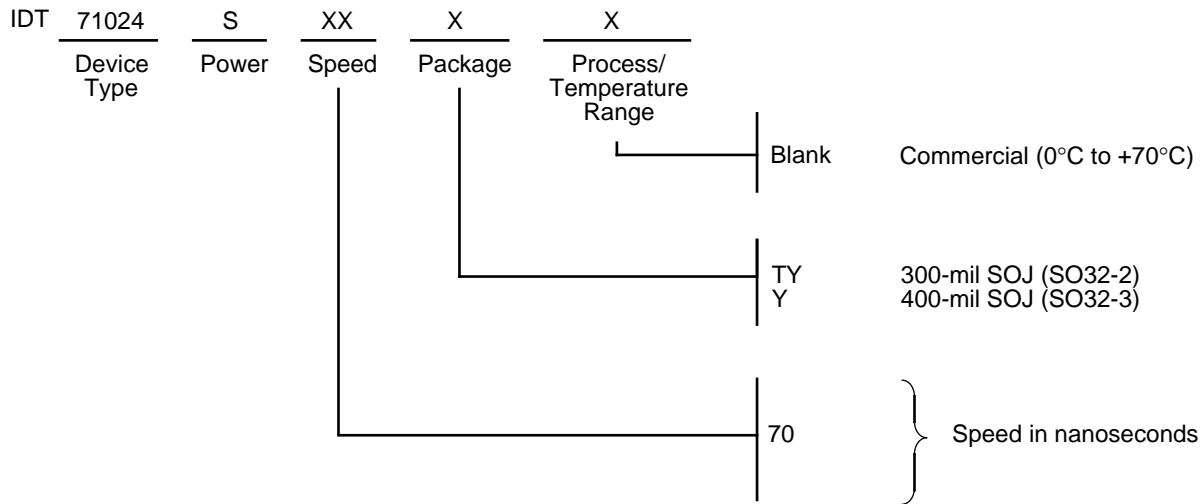

3568 drw 08

NOTES:

1. \overline{WE} must be HIGH, $\overline{CS1}$ must be HIGH, or CS2 must be LOW during all address transitions.
2. A write occurs during the overlap of a LOW $\overline{CS1}$, HIGH CS2, and a LOW \overline{WE} .
3. tWR is measured from the earlier of either $\overline{CS1}$ or \overline{WE} going HIGH or CS2 going LOW to the end of the write cycle.
4. During this period, I/O pins are in the output state, and input signals must not be applied.
5. If the $\overline{CS1}$ LOW transition or the CS2 HIGH transition occurs simultaneously with or after the \overline{WE} LOW transition, the outputs remain in a high impedance state. $\overline{CS1}$ and CS2 must both be active during the tcw write period.
6. Transition is measured $\pm 200\text{mV}$ from steady state.
7. \overline{OE} is continuously HIGH. During a \overline{WE} controlled write cycle with \overline{OE} LOW, tWP must be greater than or equal to tWHZ + tDW to allow the I/O drivers to turn off and data to be placed on the bus for the required tDW. If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the minimum write pulse is the specified tWP.
