

Overvoltage protected AC switch (ACS™)

Datasheet – production data

Description

The ACS108-8SUN belongs to the AC line switch range (built with A.S.D.® technology). This high performance switch can control a load of up to 0.8 A.

The ACS108-8SUN switch includes an overvoltage crowbar structure to absorb the overvoltage energy and a gate level shifter driver to separate the digital controller from the main switch. It is triggered with a negative gate current flowing out of the gate pin.

Features

- Less footprint area than SOT-223 (saves PCB)
- ECOPACK®2 compliant component
- Thinner option versus SOT-223 (1.1 mm max. thickness)
- Enables equipment to meet IEC 61000-4-5
- High noise immunity against static dV/dt and IEC 61000-4-4 burst
- Overvoltage protection by crowbar technology
- Needs no external protection snubber or varistor
- Reduces component count by up to 80% and Interfaces directly with the micro-controller
- V_{CL} gives headroom before clamping then crowbar action
- Common package tab connection supports connection of several alternating current switches on the same cooling pad

Applications

- Alternating current on/off static switching in appliances and industrial control systems
- Drive of low power high inductive or resistive loads like:
 - relay, valve, solenoid, dispenser,
 - pump, fan, low power motor, door lock,
 - lamp

2 Alternating current line switch - basic application

The ACS108-8SUN switch is triggered by a negative gate current flowing from the gate pin G. The switch can be driven directly by the digital controller through a resistor as shown in [Figure 16](#).

Thanks to its overvoltage protection and turn-off commutation performance, the ACS108-8SUN switch can drive a small power high inductive load with neither varistor nor additional turn-off snubber.

Figure 16. Typical application program

2.1 Protection against overvoltage: the best choice is ACS

In comparison with standard Triacs, which are not robust against surge voltage, the ACS108-8SUN is over-voltage self-protected, specified by the new parameter V_{CL} . This feature is useful in two operating conditions: in case of turn-off of very inductive load, and in case of surge voltage that can occur on the electrical network.

2.1.1 High inductive load switch-off: turn-off overvoltage clamping

With high inductive and low RMS current loads the rate of decrease of the current is very low. An overvoltage can occur when the gate current is removed and the OUT current is lower than I_H .

As shown in [Figure 17](#) and [Figure 18](#), at the end of the last conduction half-cycle, the load current decreases (1). The load current reaches the holding current level I_H (2), and the ACS108-8SUN turns off (3). The water valve, as an inductive load (up to 15 H), reacts as a current generator and an overvoltage is created, which is clamped by the ACS108-8SUN (4). The current flows through the ACS108-8SUN avalanche and decreases linearly to zero. During this time, the voltage across the switch is limited to the clamping voltage V_{CL} . The energy stored in the inductance of the load is dissipated in the clamping section that is designed for this purpose. When the energy has been dissipated, the ACS108-8SUN voltage falls back to the mains voltage value (5) (230 V_{rms}, 50 Hz).

Figure 17. Effect of the switching off of a high inductive load - typical clamping capability of ACS108-8SUN ($T_{amb} = 25\text{ }^{\circ}\text{C}$)

Figure 18. Description of the different steps during switching off of a high inductive load

2.1.2 Alternating current line transient voltage ruggedness

The ACS108-8SUN switch is able to withstand safely the ac line transients either by clamping the low energy spikes or by breaking over under high energy shocks, even with high turn-on current rises.

The test circuit shown in *Figure 19* is representative of the final ACS108-8SUN application, and is also used to test the ac switch according to the IEC 61000-4-5 standard conditions. Thanks to the load limiting the current, the ACS108-8SUN switch withstands the voltage spikes up to 2 kV above the peak line voltage. The protection is based on an overvoltage crowbar technology. Actually, the ACS108-8SUN breaks over safely as shown in *Figure 20*. The ACS108-8SUN recovers its blocking voltage capability after the surge (switch off back at the next zero crossing of the current).

Such non-repetitive tests can be done 10 times on each ac line voltage polarity.
