

## EIAJ Sound Multiplexing Decoder

### Description

The CXA2013M is a bipolar IC designed as EIAJ TV sound multiplexing decoder, provides various functions including sound multiplexing demodulation, broadcast mode identification (stereo/bilingual discrimination display), volume, tone control and muting.

### Features

- Adjustment free of filter
- Audio multiplexing decoder
- Sound processor
  - One external input
  - Bass control
  - Treble control
  - Volume control
  - Balance control

are all included in a single chip. Almost any sort of signal processing is possible through this IC.

- Separation adjustment, each mode control and sound processor control are possible through I<sup>2</sup>C BUS.

### Absolute Maximum Ratings (Ta = 25°C)

- Supply voltage  $V_{CC}$  12 V
- Operating temperature  $T_{opr}$  -20 to +75 °C
- Storage temperature  $T_{stg}$  -65 to +150 °C
- Allowable power dissipation  $P_D$  1000 mW

**Operating Supply Voltage Range** 8.5 to 9.5 V

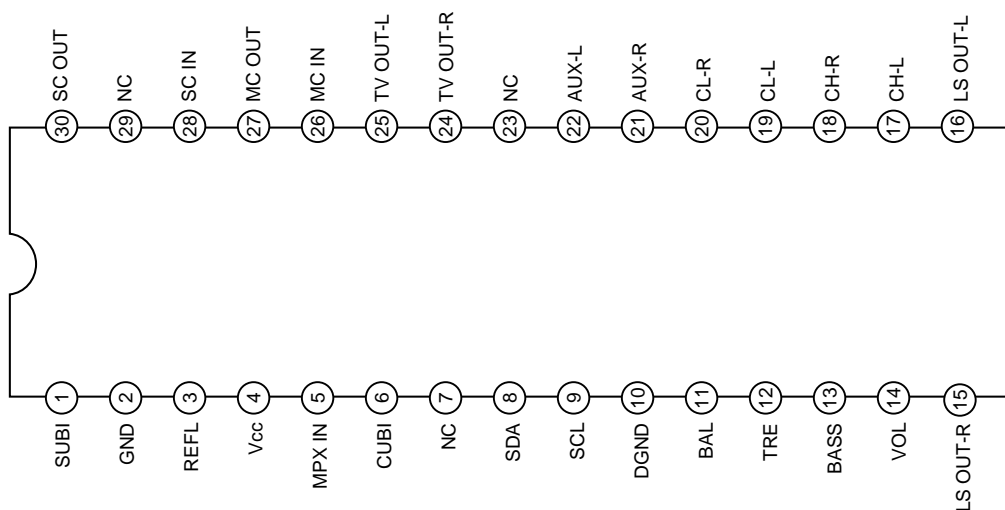

### Applications

TVs

### Structure

Bipolar silicon monolithic IC

### Pin Configuration

Sony reserves the right to change products and specifications without prior notice. This information does not convey any license by any implication or otherwise under any patents or other right. Application circuits shown, if any, are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits.

Pin Description

(Ta = 25°C, Vcc = 9V)

Pin No.	Symbol	Pin voltage	Equivalent circuit	Description
1	SUBI	4.1V		Bias capacitor connection of sub FM detector
2	GND	0		Analog block GND
3	REFL	1.2V		The noise elimination filter connection of internal reference voltage
4	Vcc	—		Power supply
5	MPX IN	4.1V		Sound multiplexing signal input. Typical input level = 110mVrms (monoural 100%)
6	CUBI	4.1V		Bias capacitor connection of Cue pulse generator
7, 23, 29	NC	—	—	—

Pin No.	Symbol	Pin voltage	Equivalent circuit	Description
8	SDA	—		Serial data I/O pin $V_{IH} > 3.0V$ $V_{IL} < 1.5V$
9	SCL	—		Serial clock I/O pin $V_{IH} > 3.0V$ $V_{IL} < 1.5V$
10	DGND	—		Digital block GND
11	BAL	4.2V		DAC output pin. (BAL) Connect LPF capacitance of DAC. Internal impedance is approximately 20kΩ.
12	TRE	4.2V		DAC output pin. (TRE) Connect LPF capacitance of DAC. Internal impedance is approximately 20kΩ.
13	BASS	4.2V		DAC output pin. (BASS) Connect LPF capacitance of DAC. Internal impedance is approximately 20kΩ.
14	VOL	5.2V		DAC output pin. (VOL) Connect LPF capacitance of DAC. Internal impedance is approximately 5kΩ.

Pin No.	Symbol	Pin voltage	Equivalent circuit	Description
15	LS OUT-R	4.2V		LSOUT right channel output pin
16	LS OUT-L	4.2V		LSOUT left channel output pin
17	CH-L	4.2V		Treble filter pin (Left channel)
18	CH-R	4.2V		Treble filter pin (Right channel)
19	CL-L	4.2V		Bass filter pin (Left channel)
20	CL-R	4.2V		Bass filter pin (Right channel)
21	AUX-R	4.2V		Right channel external input pin
22	AUX-L	4.2V		Left channel external input pin

Pin No.	Symbol	Pin voltage	Equivalent circuit	Description
24	TV OUT-R	4.2V		TVOUT right channel output pin
25	TV OUT-L	4.2V		TVOUT left channel output pin
26	MC IN	4.1V		DC cut capacitor connection of main signal
27	MC OUT	3.4V		
28	SC IN	4.1V		DC cut capacitor connection of sub signal
30	SC OUT	3.9V		

## Electrical Characteristics

**Adjustment method**

## Separation adjustment

**Fig. 1****Procedure**

- 1) Connect components as shown in Fig.1. (TEST = 0)
- 2) Set the encoder to MONO mode, and input 110mVrms (1kHz 100% modulation) to MPX IN (Pin 5).
- 3) Set the encoder to stereo mode, and input only left channel signal (1kHz 100% modulation) to MPX IN (Pin 5).
- 4) Monitor the oscilloscope and AC voltmeter and adjust ATT so that the R-ch is at a minimum. (Separation standard: more than 35dB)

## Description of registers

### Control registers

Register	Number of bits	Classification*	Standard setting	Contents
TEST	1	T	0	DAC test mode for VCA, checking Cue BPF mode. 1: TEST
ATT	7	A	34	Adjustment of stereo separation
EXT	1	U	0	Selection of TV mode or external input mode for LSOUT output 1: External
FOMO	1	U	0	Selection of forced MONO mode ON/OFF 1: Forced MONO
S1	1	U	0	Selection of TV OUT, LS OUT output signal
S0	1	U	0	Selection of TV OUT, LS OUT output signal
MUTE TV	1	U	1	Selection of TV OUT mute ON/OFF 0: Mute ON, 1: Mute OFF
MUTE LS	1	U	1	Selection of LS OUT mute ON/OFF 0: Mute ON, 1: Mute OFF
BASS	5	U	10	LS OUT output bass control
TREBLE	5	U	10	LS OUT output treble control
VOL	8	U	FF	LS OUT output signal level control
BAL	6	U	20	LS OUT-L, R output signal level (balance) control

\* Classification U: User control

A: Adjustment

T: Test (when IC manufactured)

### Status Registers

Register	Number of bits	Contents
PON	1	POWER ON RESET detection 1: RESET
ST	1	Stereo detection of the MPXIN input signal 1: Stereo
BIL	1	Bilingual detection of the MPXIN input signal 1: Bilingual

## Description of Control Registers

- TEST (1) : DAC test mode for VCA and checking Cue BPF mode.  
Use only for the electrical characteristics inspection process of IC.  
0 = Normal mode  
1 = Test mode, the Cue signal component through Cue BPF to TV OUT-L.  
Output DAC voltage for VCA to TV OUT-R.
- ATT (7) : Perform the separation adjustment by varying the signal level input to MPX IN (Pin 5).  
Variable range of the input signal: Normal input level  $\pm 3.0\text{dB}$   
0 = Level Min.  
34 = Center  
7F = Level Max.
- EXT (1) : Select TV mode or external input mode for LS OUT output  
0 = TV mode  
1 = External input mode
- FOMO (1) : Select ON/OFF forced MONO mode  
0 = Forced MONO OFF  
1 = Forced MONO ON
- S1 (1) : Select output signal for TV OUT, LS OUT
- S0 (1) : Select output signal for TV OUT, LS OUT
- MUTE TV (1) : Mute TV OUT output  
0 = Mute ON  
1 = Mute OFF
- MUTE LS (1) : Mute LS OUT output  
0 = Mute ON  
1 = Mute OFF
- BASS (5) : LS OUT output bass control  
0 = Bass Min.  
10 = Bass Center (0dB)  
1F = Bass Max.
- TREBLE (5) : LS OUT output treble control  
0 = Treble Min.  
10 = Treble Center (0dB)  
1F = Treble Max.
- VOL (8) : LS OUT output signal level control  
0 = Volume Min. (-90dB Typ.)  
FF = Volume Max. (0dB)
- BAL (6) : LS OUT-L, R output signal level (balance) control  
0 = Lch Min., Rch Max.  
20 = Center (Lch 0dB, Rch 0dB)  
3F = Lch Max., Rch Min.

**Description of Mode Control**

**TV OUT output mode control table (TEST = 0 normal mode)**

Input signal	Mode detection		Mode control				TV OUT output	
	ST	BIL	FOMO	S1	S0	MUTE TV	L	R
MONO	0	0	*	*	*	0	MUTE	MUTE
			*	*	*	1	MAIN	MAIN
Stereo	1	0	*	*	*	0	MUTE	MUTE
			1	*	*	1	L + R	L + R
			0	0	0	1	L	R
			0	0	1	1	L	R
Bilingual	0	1	*	*	*	0	MUTE	MUTE
			*	0	0	1	MAIN	MAIN
			*	0	1	1	SUB	SUB
			*	1	0	1	MAIN	SUB

\*: Don't care

**LS OUT output mode control table (TEST = 0 normal mode, EXT = 0 TV mode)**

Input signal	Mode detection		Mode control				LS OUT output	
	ST	BIL	FOMO	S1	S0	MUTE LS	L	R
MONO	0	0	*	*	*	0	MUTE	MUTE
			*	*	*	1	MAIN	MAIN
Stereo	1	0	*	*	*	0	MUTE	MUTE
			1	*	*	1	L + R	L + R
			0	0	0	1	L	R
			0	0	1	1	L	R
Bilingual	0	1	*	*	*	0	MUTE	MUTE
			*	0	0	1	MAIN	MAIN
			*	0	1	1	SUB	SUB
			*	1	0	1	MAIN	SUB

\*: Don't care

**TV OUT/LS OUT output mode control table (TEST = 0 normal mode)**

	EXT	TV OUT		LS OUT	
		L	R	L	R
TV mode	0	TV mode Lch	TV mode Rch	TV mode Lch	TV mode Rch
External mode	1	TV mode Lch	TV mode Rch	EXT Lch	EXT Rch

## Description of Operation

The sound multiplexing signal input from Pin 5 is passed through IN AMP and is applied to the Cue BPF, Sub BPF, and Main de-emphasis circuit.

### 1. Discrimination circuits

Cue BPF passes only the Cue signal component from the multiplex signal. In the AM demodulator, the signal (AM wave) is AM detected and one of two sine waves is generated, either a 922.5Hz signal for bilingual broadcasts or a 982.5Hz signal for stereo broadcasts.

In the 952Hz BPF, the 3.5fH carrier component is eliminated from the Cue signal after AM wave detection. The Cue signal, from which the carrier component has been eliminated, is waveform shaped by COMP, with the resulting 922.5Hz or 982.5Hz pulse being applied to the Logic section.

In the 3.5fH VCO, a 3.5fH pulse locked onto the Cue signal carrier (3.5fH) is created and sent to the Logic section.

In the Logic section, the broadcast mode is identified using the countdown method. Depending on this result as well as the presence of a SUB signal from SUB detector and the MUTE ON/OFF, MODE switching, and FOMO ON/OFF instructions from CONT, the output switching control signal is created. This signal is used to control the output condition of OUTPUT SW and MAIN OUT.

### 2. Main circuits

In MAIN DEEM, de-emphasis is applied to the Main signal component and the Sub and Cue components are removed.

After passing through the MAIN DEEM, the Main signal is applied to MATRIX, OUTPUT AMP, and MAINOUT.

### 3. Sub circuits

In SUB BPF, only the SUB signal component out of multiplex signals is passed through. In the 4.5fH trap, the digital facsimile signal component is removed.

In FM Demod, the SUB signal is FM demodulated.

In SUB DEEM, the FM demodulated Sub signal is de-emphasized and the carrier component is removed. After passing through SUB DEEM, the Sub signal is applied to MATRIX and OUTPUT AMP.

### 4. MATRIX and output circuits

In MATRIX, the L and R signals are created by adding and subtracting the Main signal from MAIN DEEM and the Sub signal from SUB DEEM in stereo broadcast.

In OUTPUT AMP and OUTPUT SW, the output signal is switched under the control of Logic.

In addition, MAIN OUT always outputs the MAIN signal component, regardless of the broadcast mode.

### 5. TONE circuit

Control BASS and TREBLE. Bass and TREBLE characteristics are decided by each C<sub>L</sub> and C<sub>H</sub> external capacitance.

### 6. BALANCE, VOLUME circuit

Control BALANCE and VOLUME. BALANCE has 64steps and VOLUME has 256 steps.

### 7. DAC

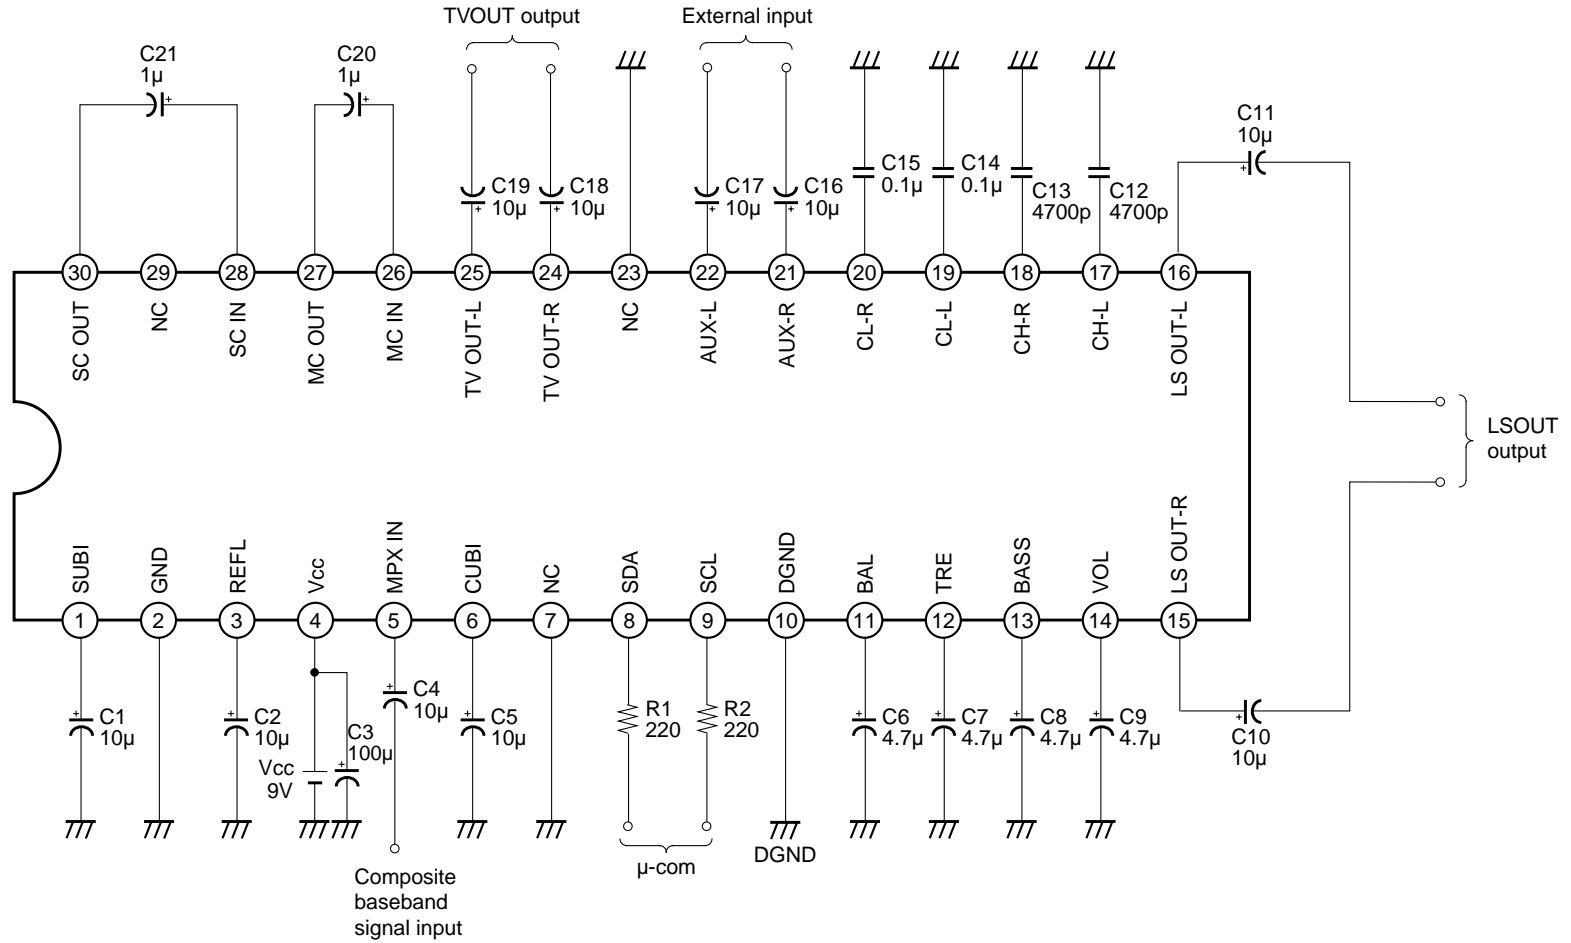

DAC is the circuit that control BASS, TREBLE, VOLUME and BALANCE.

Internal impedance is approximately 20k $\Omega$  (approximately 5k $\Omega$  for VOLUME).

Connect the external capacitance for LPF to each pins.

# Application Circuit

- 17 -

Application circuits shown are typical examples illustrating the operation of the devices. Sony cannot assume responsibility for any problems arising out of the use of these circuits or for any infringement of third party patent and other right due to same.

**I<sup>2</sup>C Bus Block Items (SDA, SCL)**

I<sup>2</sup>C bus load conditions: Pull-up resistor 4kΩ (Connect to +5V)  
 Load capacitor 200pF (Connect to GND)

**I<sup>2</sup>C Bus Control Signal**

**I<sup>2</sup>C Bus Signal**

There are I<sup>2</sup>C signals, SDA (Serial DATA) and SCL (Serial CLOCK) signals. SDA is a bidirectional signal.

- Accordingly there are 3 values outputs, H, L, and Hi-Z.

- I<sup>2</sup>C transfer begins with Start Condition and ends with STOP condition.

• I<sup>2</sup>C data write (Write from I<sup>2</sup>C controller to the IC)

• I<sup>2</sup>C data read (Read from the IC to I<sup>2</sup>C controller)

• Read timing

\* Data Read is performed during SCL rise.
