

Single-PLL General-Purpose EPROM Programmable Clock Generator

Features

- Single phase-locked loop architecture
- EPROM programmability
- Factory-programmable (CY2071A, CY2071AI) or field-programmable (CY2071AF, CY2071AFI) device options
- Up to three configurable outputs
- Low-skew, low-jitter, high-accuracy outputs
- Internal loop filter
- Power management (OE)
- Frequency select options
- Configurable 5V or 3.3V operation
- 8-pin 150-mil SOIC package

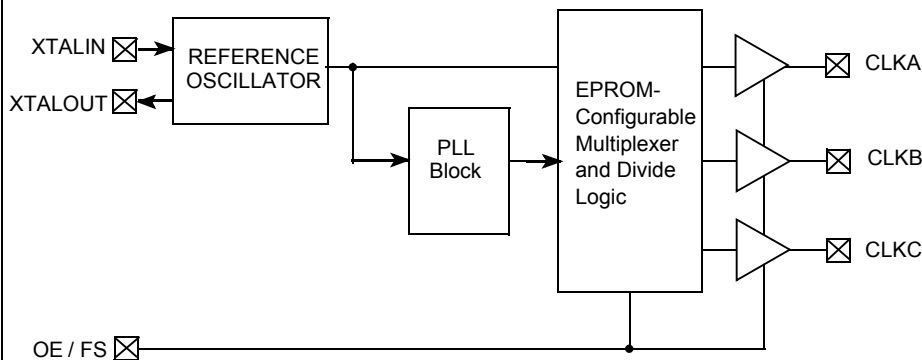

Benefits

- Generates a custom frequency from an external source
- Easy customization and fast turnaround
- Programming support available for all opportunities
- Generates three related frequencies from a single device
- Meets critical industry standard timing requirements
- Alleviates the need for external components
- Supports low-power applications
- Three outputs with two user-selectable frequencies
- Supports industry standard design platforms
- Industry-standard packaging saves on board space

Functional Description

The CY2071A is a general-purpose clock synthesizer designed for use in applications such as modems, disk drives, CD-ROM drives, video CD players, games, set-top boxes, and data/telecommunications. The device offers up to three configurable clock outputs in an 8-pin, 150-mil SOIC package and can operate off either a 3.3V or 5V power supply. The on-chip reference oscillator is designed for 10-MHz to 25-MHz crystals. Alternatively, an external reference clock of frequency between 1 MHz and 30 MHz can be used.

The CY2071A has one PLL and outputs three factory-EPROM configurable clocks: CLKA, CLKB, and CLKC. The output clocks can originate either from the PLL or the reference, or selected dividers thereof. Additionally, pin 8 can be configured to be an Output Enable or a Select input.

The CY2071A can replace multiple Metal Can Oscillators (MCO) in a synchronous system, providing cost and board space savings to the manufacturer. Hence, these devices are ideally suited for applications that require multiple, accurate, and stable clocks synthesized from low-cost generators in small packages. A hard-disk drive is an example of such an application. In this case, CLKA drives the PLL in the Read Controller, while CLKB and CLKC drive the MCU and associated sequencers.

Notes:

1. For best accuracy, use a parallel-resonant crystal, C_L = 17 pF.
2. Float XTALOUT pin if XTALIN is driven by reference clock (as opposed to an external crystal).

CyClocks Software

CyClocks™ is an easy-to-use software application that allows you to configure any one of the EPROM-Programmable Clocks offered by Cypress. You may specify the input frequency, PLL and output frequencies, and different functional options. Please note the output frequency ranges in this data sheet when specifying them in CyClocks to ensure that you stay within the limits. You can download a copy of CyClocks free on the Cypress Semiconductor Corporation web site at www.cypress.com.

Consider using the CY2081 for applications that require unrelated output frequencies. Consider using the CY2291, CY2292, or CY2907 for applications that require more than three output clocks.

Cypress FTG Programmer

The Cypress Frequency Timing Generator (FTG) Programmer is a portable programmer designed to custom program our family of EPROM Field Programmable Clock Devices. The FTG programmers connect to a PC serial port and allow users of CyClocks software to quickly and easily program any of the CY2291F, CY2292F, CY2071AF, and CY2907F devices. The ordering code for the Cypress FTG Programmer is CY3670.

I_{IL}	Input LOW Current	$V_{IN} = 0.5V$			150	μA
I_{OZ}	Output Leakage Current	Three State Outputs			250	μA
I_{DD}	V_{DD} Supply Current ^[5]	$V_{DD} = V_{DD}$ max. 3.3V operation, $C_L = 15$ pF		24	40	mA

Notes:

- Electrical parameters are guaranteed with these operating conditions. Values for 3.3V operation are shown in parentheses.
- External input reference clock must have a duty cycle between 40% and 60%, measured at $V_{DD}/2$.
- Please refer to application note "Crystal Oscillator Topics" for information on AC-coupling the external input reference clock.
- Xtal inputs have CMOS thresholds.
- Load = max, typical configuration, $f_{REF} = 14.318$ MHz. Specific configurations may vary. A close approximation of I_{DD} can be derived by the following formula:
 $I_{DD}(mA) = V_{DD} * (6.25 + (0.055 * F_{REF}) + (0.0017 * C_{LOAD} * (F_{CLKA} + F_{CLKB} + F_{CLKC})))$. C_{LOAD} is specified in pF and F is specified in MHz.

Electrical Characteristics, Industrial 5.0V $V_{DD} = 5.0V \pm 10\%$, $T_A = -40^\circ C$ to $+85^\circ C$

Parameter	Description	Conditions	Min.	Typ.	Max.	Unit

Notes:

6. Guaranteed by design, not 100% tested.
7. When the output clock frequency is between 100 MHz and 130 MHz at 5V, the maximum capacitive load for these measurements is 15 pF.
8. Reference Output duty cycle depends on XTALIN duty cycle.
9. Measured at 1.4V.
