

FEATURES

- two output pairs, adjustable from 0 to 1100 mVp-p into 75 Ω loads
- nominal 600 ps rise and fall times
- accepts SMPTE and standard ECL input levels
- operates from a single +5 or -5 volt supply
- on-chip DC restoration for low jitter
- 250 mW power dissipation
- interfaces with **GENLINX™ GS9002, GS9004A, GS9005A and GS9015A**

APPLICATIONS

- SMPTE 259M Serial Digital Systems (4:2:2 & 4fsc)
- Other Serial Digital Video Interfaces - 360 Mb/s
- General purpose high speed driver applications

DEVICE DESCRIPTION

The **GENLINX™** GS9009 is a bipolar integrated circuit designed to drive four 75 Ω co-axial cables at data rates exceeding 400 Mb/s. It directly interfaces with other **GENLINX™** devices and can also be used as a general purpose high speed cable driver.

The differential inputs are AC-coupled and internally DC-restored which allows correct passage of pathological check codes associated with the serial digital standards. Even though the inputs are AC coupled, static protection diodes at each input restrict the DC differential so that if the driving source uses the opposite polarity power supply, external DC blocking capacitors must be used.

Correctly terminated output signal levels are adjustable from as low as 0 mV to as high as 1100 mV with little change in other performance parameters. Performance is guaranteed for output levels between 600 mV and 1000 mV. The gain of the output stages is varied by adjusting the V_{SET} voltage with respect to an internal bandgap reference voltage V_{REF} .

Pinout is compatible with the GS9007 by interchanging pins 3,4,5,6,9,10,11,12 on the GS9009 with pins 1,2,3,4,5,6,7,8 on the GS9007. In this way, a layout can be made for either device depending on whether adjustability is desired or not.

The GS9009 is packaged in a 14 pin SOIC, and operates from a single +5 or -5 volt supply consuming typically only 250 mW of power.

NOTE 1. V_{OUT} is measured across a correctly terminated load, back matched to the device. The peak to peak voltage of the device itself is $2 \times V_{OUT}$.

2. V_{OUT} is proportional to V_{SET} and V_{SET} may be an external low impedance, high stability supply. In this case the amplitude temperature coefficient will not be guaranteed.
