

Low Charge Injection 8-Channel High Voltage Analog Switch with Bleed Resistors

Ordering Information

$V_{PP} - V_{NN}$	Package Options			
	28-lead plastic chip carrier	48-lead TQFP	μ -BGA	Die
200V	HV232PJ	HV232FG	HV232GA	HV232X

Features

- HVCMOS[®] technology for high performance
- Very low quiescent power dissipation – 10 μ A
- Output On-resistance typically 22 ohms
- Integrated bleed resistors on the outputs
- Low parasitic capacitances
- DC to 10MHz analog signal frequency
- 60dB typical output off isolation at 5MHz
- CMOS logic circuitry for low power
- Excellent noise immunity
- On-chip shift register, latch and clear logic circuitry
- Flexible high voltage supplies
- Surface mount package available

General Description

The Supertex HV232 is a low charge injection 8-channel high-voltage analog switch integrated circuit (IC) with bleed resistors. The device can be used in applications requiring high voltage switching controlled by low voltage control signals, such as ultrasound imaging and printers. The bleed resistors eliminate voltage built up on capacitive loads such as piezoelectric transducers. Input data is shifted into an 8-bit shift register which can then be retained in an 8-bit latch. To reduce any possible clock feed-through noise, Latch Enable Bar (LE) should be left high until all bits are clocked in. Using HVCMOS technology, this switch combines high voltage bilateral DMOS switches and low power CMOS logic to provide efficient control of high voltage analog signals.

This IC is suitable for various combinations of high voltage supplies, e.g., V_{PP}/V_{NN} : +50V/-150V, or +100V/-100V.

Absolute Maximum Ratings*

V_{DD} Logic power supply voltage	-0.5V to +15V	
$V_{PP} - V_{NN}$ Supply voltage	220V	
V_{PP} Positive high voltage supply	-0.5V to $V_{NN} + 200V$	
V_{NN} Negative high voltage supply	+0.5V to -200V	
Logic input voltages	-0.5V to $V_{DD} + 0.3V$	
Analog Signal Range	V_{NN} to V_{PP}	
Peak analog signal current/channel	3.0A	
Storage temperature	-65°C to +150°C	
Power dissipation	μ -BGA	1.0W
	28-pin PLCC	1.2W
	48 lead TQFP	1.0W

* Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability.

Notes:

1. The eight switches operate independently.
2. Serial data is clocked in on the L→ H transition CLK.
3. The switches go to a state retaining their present condition at the rising edge of \overline{LE} . When \overline{LE} is low the shift register data flows through the latch.
4. D_{OUT} is high when switch 7 is on.
5. Shift register clocking has no effect on the switch states if \overline{LE} is H.
6. The clear input overrides all other inputs.
