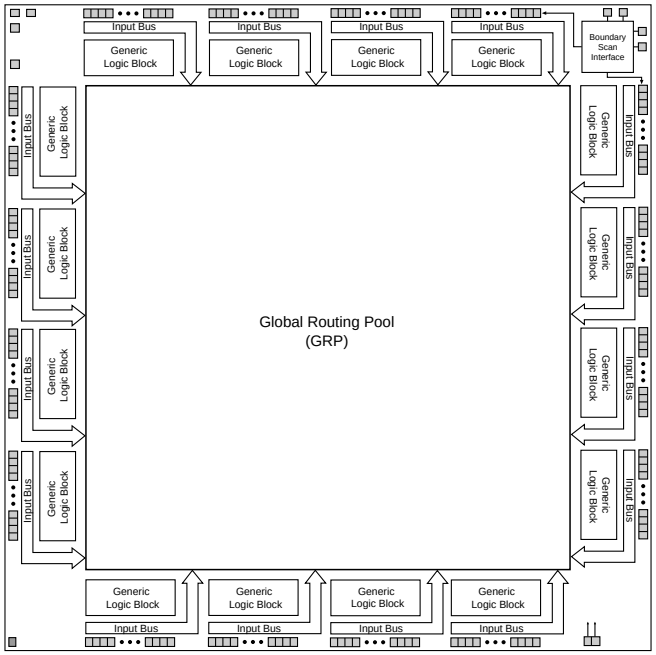
ispLSI® 5512VA

In-System Programmable 3.3V SuperWIDE™ High Density PLD

Features

- **SuperWIDE HIGH-DENSITY IN-SYSTEM PROGRAMMABLE LOGIC**
  - **— 3.3V Power Supply**
  - **— User Selectable 3.3V/2.5V I/O**
  - **— 24000 PLD Gates / 512 Macrocells**
  - **— Up to 288 I/O Pins**
  - **— 512 Registers**
  - **— High-Speed Global Interconnect**
  - **— SuperWIDE 32 Generic Logic Block (GLB) Size for Optimum Performance**
  - **— SuperWIDE Input Gating (68 Inputs) for Fast Counters, State Machines, Address Decoders, etc.**
  - **— PCB Efficient Ball Grid Array (BGA) Package Options**
  - **— Interfaces with Standard 5V TTL Devices**
- **HIGH PERFORMANCE E²CMOS® TECHNOLOGY**
  - **— fmax = 110 MHz Maximum Operating Frequency**
  - **— tpd = 8.5 ns Propagation Delay**
  - **— Enhanced tsu2 = 7 ns, tsu3 (CLK0/1) = 4.5ns, tsu3 (CLK2/3) = 3.5ns**
  - **— TTL/3.3V/2.5V Compatible Input Thresholds and Output Levels**
  - **— Electrically Erasable and Reprogrammable**
  - **— Non-Volatile**
  - **— Programmable Speed/Power Logic Path Optimization**
- **IN-SYSTEM PROGRAMMABLE**
  - **— Increased Manufacturing Yields, Reduced Time-to-Market, and Improved Product Quality**
  - **— Reprogram Soldered Devices for Faster Debugging**
- **100% IEEE 1149.1 BOUNDARY SCAN TESTABLE AND 3.3V IN-SYSTEM PROGRAMMABLE**
- **ARCHITECTURE FEATURES**
  - **— Enhanced Pin-Locking Architecture with Single-Level Global Routing Pool and SuperWIDE GLBs**
  - **— Wrap Around Product Term Sharing Array Supports up to 35 Product Terms Per Macrocell**
  - **— Macrocells Support Concurrent Combinatorial and Registered Functions**
  - **— Macrocell Registers Feature Multiple Control Options Including Set, Reset and Clock Enable**
  - **— Four Dedicated Clock Input Pins Plus Macrocell Product Term Clocks**
  - **— Slew and Skew Programmable I/O (SASPI/O™) Supports Programmable Bus Hold, Pull-up, Open Drain and Slew and Skew Rate Options**
  - **— Six Global Output Enable Terms, Two Global OE Pins and One Product Term OE per Macrocell**
- **ispDesignEXPERT™ – LOGIC COMPILER AND COMPLETE ISP DEVICE DESIGN SYSTEMS FROM HDL SYNTHESIS THROUGH IN-SYSTEM PROGRAMMING**
  - **— Superior Quality of Results**
  - **— Tightly Integrated with Leading CAE Vendor Tools**
  - **— Productivity Enhancing Timing Analyzer, Explore Tools, Timing Simulator and ispANALYZER™**
  - **— PC and UNIX Platforms**

Functional Block Diagram



ispLSI 5000V Description

The ispLSI 5000V Family of In-System Programmable High Density Logic Devices is based on Generic Logic Blocks (GLBs) of 32 registered macrocells and a single Global Routing Pool (GRP) structure interconnecting the GLBs.

Outputs from the GLBs drive the Global Routing Pool (GRP) between the GLBs. Switching resources are provided to allow signals in the Global Routing Pool to drive any or all the GLBs in the device. This mechanism allows fast, efficient connections across the entire device.

Each GLB contains 32 macrocells and a fully populated, programmable AND-array with 160 logic product terms and five extra control product terms. The GLB has 68 inputs from the Global Routing Pool which are available in both true and complement form for every product term.

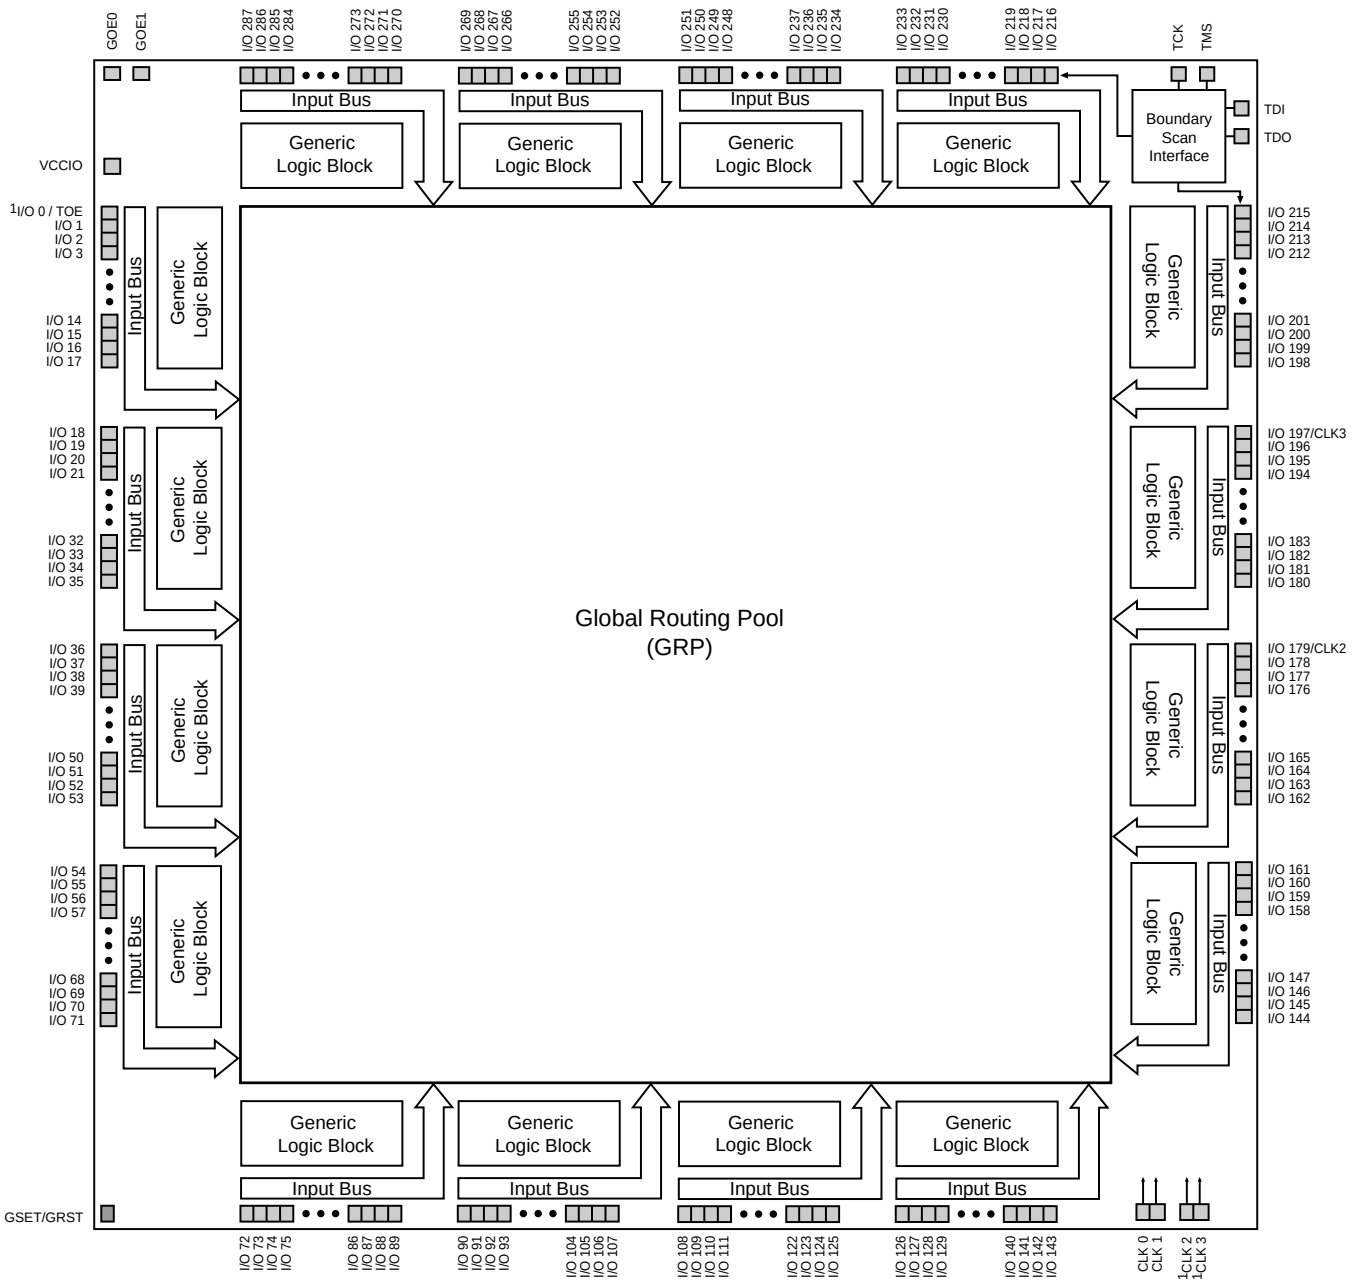
Functional Block Diagram

Figure 1. ispLSI 5512VA Functional Block Diagram (388 BGA Option)



1. CLK2, CLK3 and TOE signals are multiplexed with I/O signals. Which I/O is multiplexed is determined by the package type used – see table below.

Package Type	Multiplexed Signals		
388 BGA	I/O 179 / CLK2	I/O 197 / CLK3	I/O 0 / TOE
272 BGA	I/O 119 / CLK2	I/O 131 / CLK 3	I/O 0 / TOE
208 PQFP	I/O 89 / CLK2	I/O 98 / CLK 3	I/O 0 / TOE

ispLSI 5000V Description (Continued)

The 160 product terms are grouped in 32 sets of five and sent into a Product Term Sharing Array (PTSA) which allows sharing up to a maximum of 35 product terms for a single function. Alternatively, the PTSA can be bypassed for functions of five product terms or less. The five extra product terms are used for shared GLB controls, set, reset, clock, clock enable and output enable.

The 32 registered macrocells in the GLB are driven by the 32 outputs from the PTSA or the PTSA bypass. Each macrocell contains a programmable XOR gate, a programmable register/latch/toggle flip-flop and the necessary clocks and control logic to allow combinatorial or registered operation. The macrocells each have two outputs, which can be fed back through the Global Routing Pool. This dual output capability from the macrocell allows efficient use of the hardware resources. One output can be a registered function for example, while the other output can be an unrelated combinatorial function. A direct register input from the I/O pad facilitates efficient use of this feature to construct high-speed input registers.

Macrocell registers can be clocked from one of several global or product term clocks available on the device. A global and product term clock enable is also provided, eliminating the need to gate the clock to the macrocell registers. Reset and preset for the macrocell register is provided from both global and product term signals. The macrocell register can be programmed to operate as a D-type register, a D-type latch or a T-type flip flop.

The 32 outputs from the GLB can drive both the Global Routing Pool and the device I/O cells. The Global Routing Pool contains one line from each macrocell output and one line from each I/O pin.

The input buffer threshold has programmable TTL/3.3V/2.5V compatible levels. The output driver can source 4mA and sink 8mA in 3.3V mode. The output drivers have a separate VCCIO reference input which is independent of the main VCC supply for the device. This feature allows the output drivers to drive either 3.3V or 2.5V output levels while the device logic and the output current drive is always powered from 3.3V. The output drivers also provide individually programmable edge rates and open drain capability. A programmable pullup resistor is provided to tie off unused inputs and a programmable bus-hold latch is available to hold tristate outputs in their last valid state until the bus is driven again by some device.

The ispLSI 5000V Family features 3.3V, non-volatile in-system programmability for both the logic and the interconnect structures, providing the means to develop truly reconfigurable systems. Programming is achieved through the industry standard IEEE 1149.1-compliant Boundary Scan interface. Boundary Scan test is also supported through the same interface.

An enhanced, multiple cell security scheme is provided that prevents reading of the JEDEC programming file when secured. After the device has been secured using this mechanism, the only way to clear the security is to execute a bulk-erase instruction.

ispLSI 5000V Family Members

The ispLSI 5000V Family ranges from 256 macrocells to 512 macrocells and operates from a 3.3V power supply. All family members will be available with multiple package options. The ispLSI 5000V Family device matrix showing the various bondout options is shown in the table below.

The interconnect structure (GRP) is very similar to Lattice's existing ispLSI 1000, 2000 and 3000 families, but with an enhanced interconnect structure for optimal pin locking and logic routing. This eliminates the need for registered I/O cells or an Output Routing Pool.

Table 1. ispLSI 5000VA Family

			Package Type

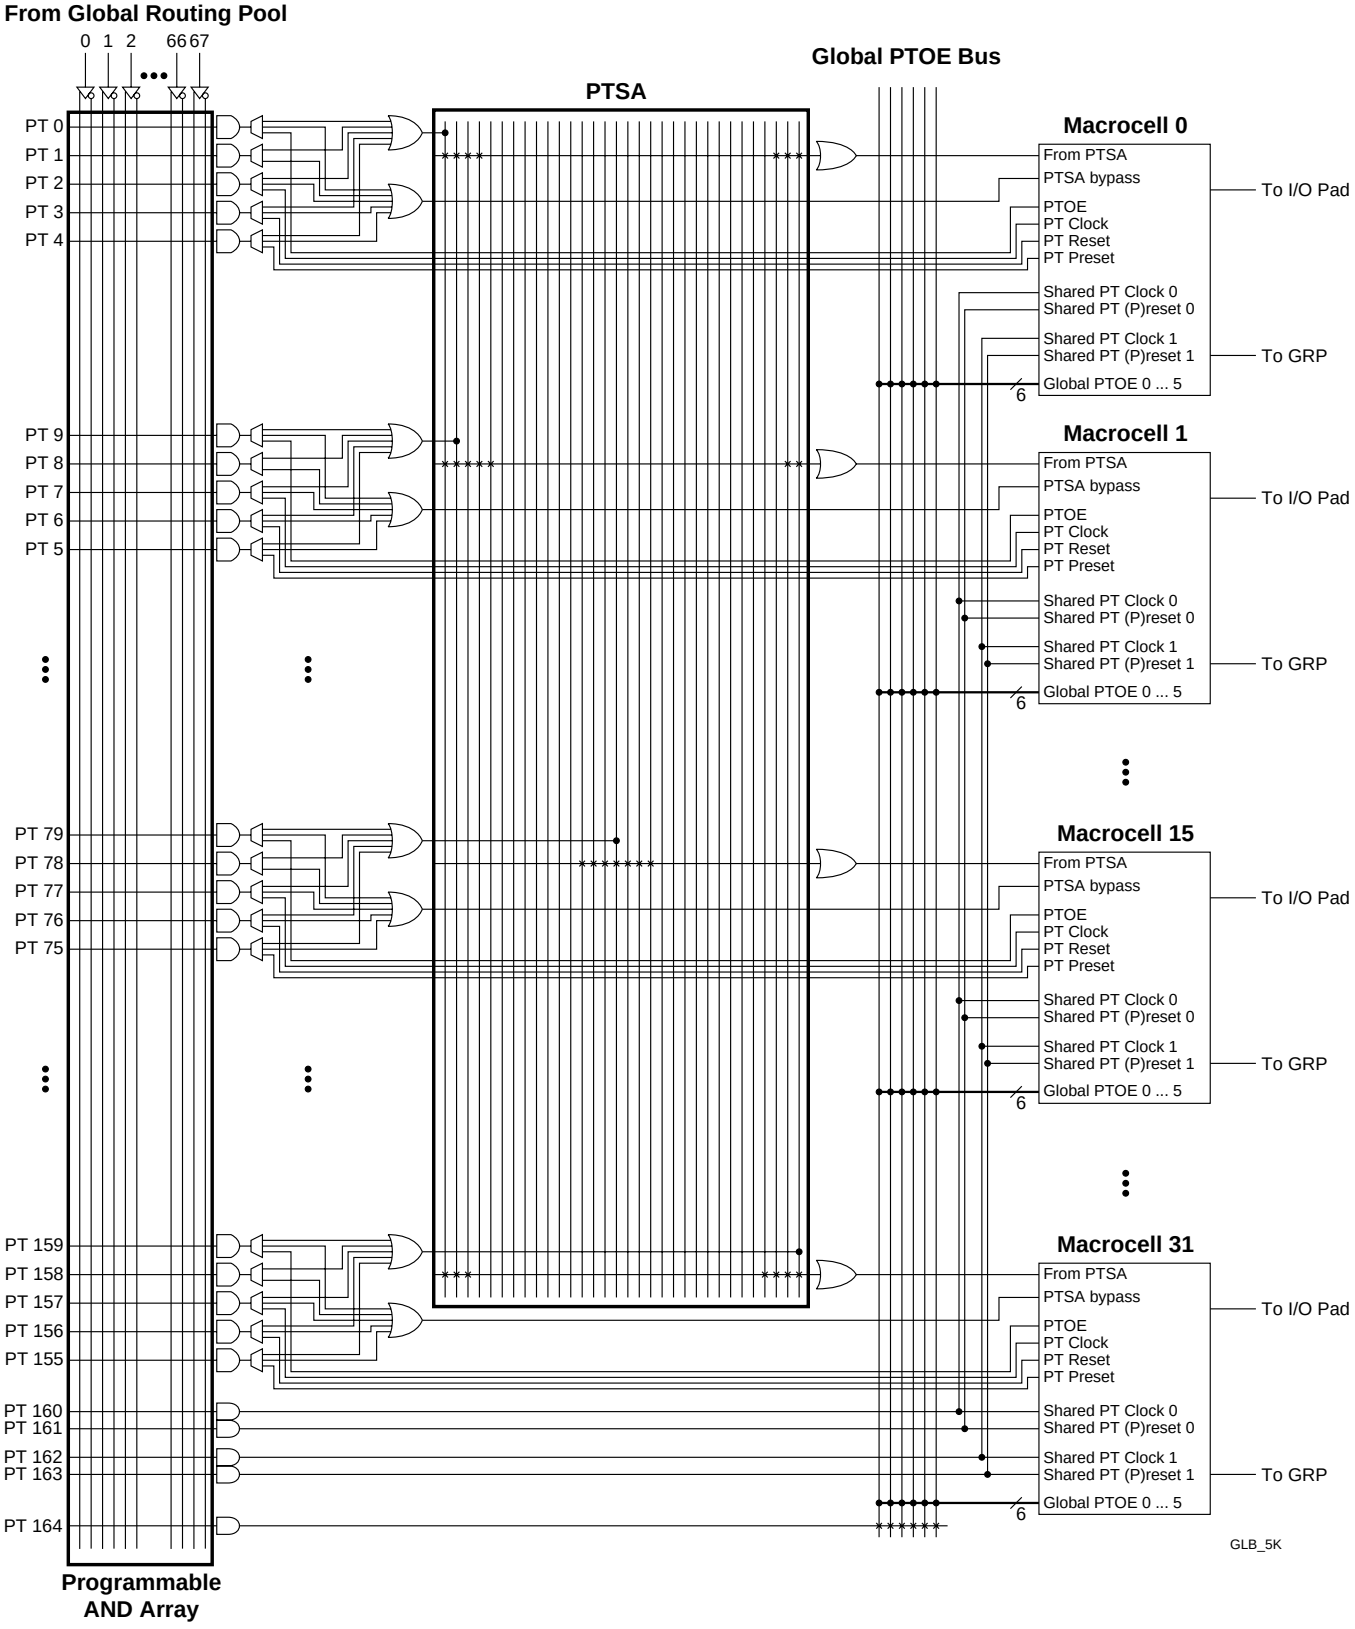

Figure 4. ispLSI 5000V Macrocell

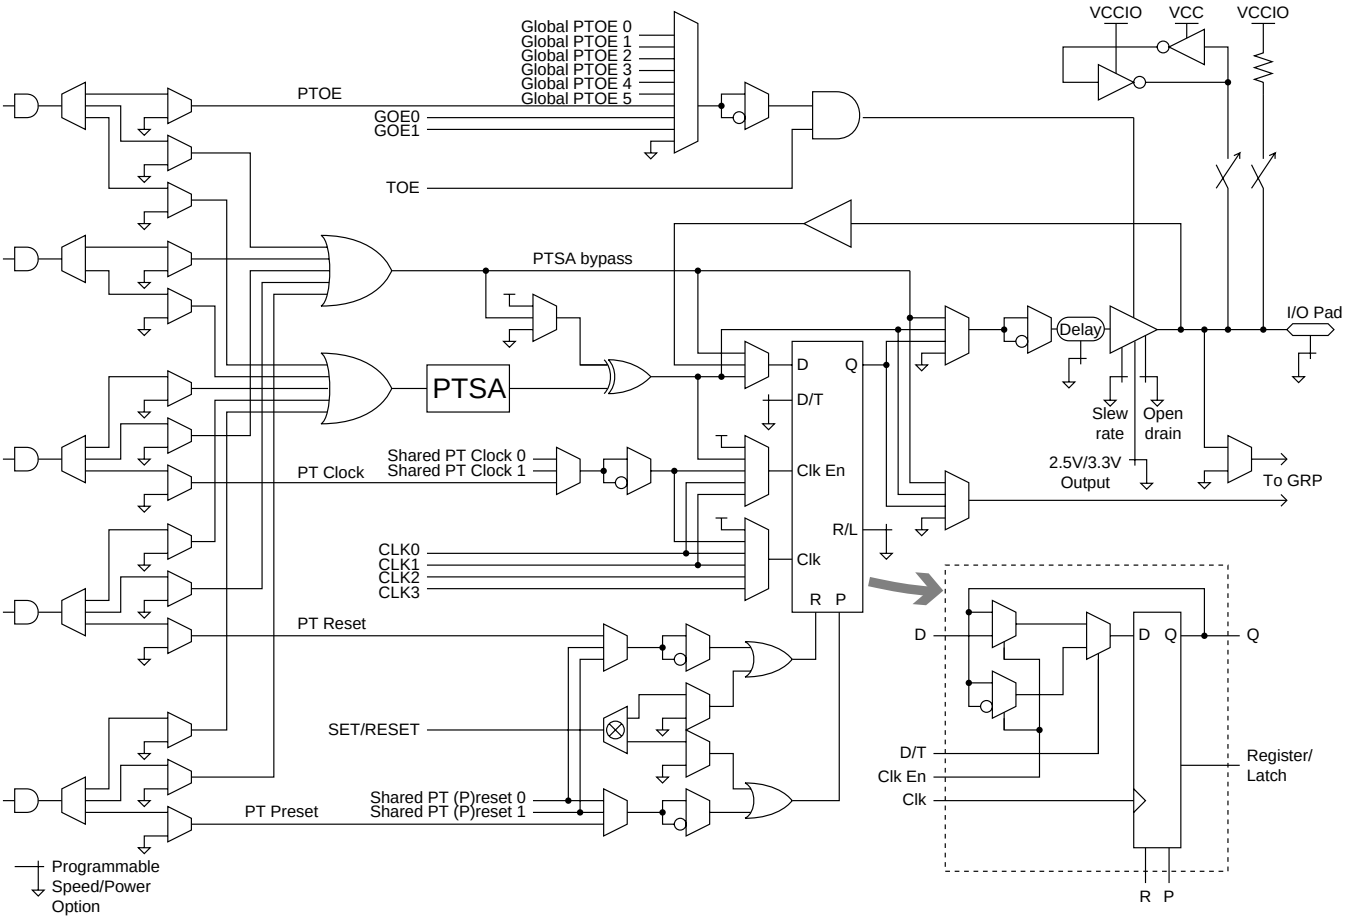

Global Clock Distribution

The ispLSI 5000V Family has four dedicated clock input pins: CLK0 - CLK3. CLK0 input is used as the dedicated master clock that has the lowest internal clock skew with no clock inversion to maintain the fastest internal clock speed. The clock inversion is available on the remaining CLK1 - CLK3 signals. By sharing the pins with the I/O pins, CLK2 and CLK3 can not only be inverted but also is available for logic implementation through GRP signal routing. Figure 5 shows these different clock distribution options.

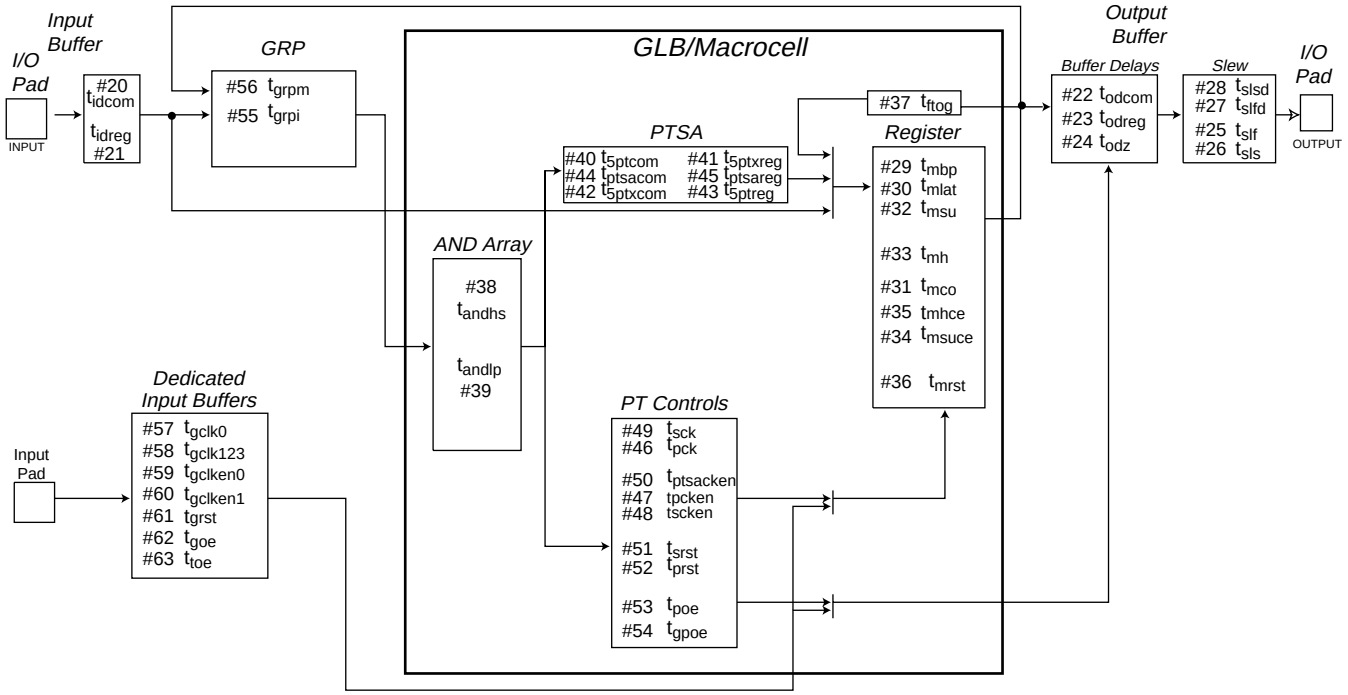
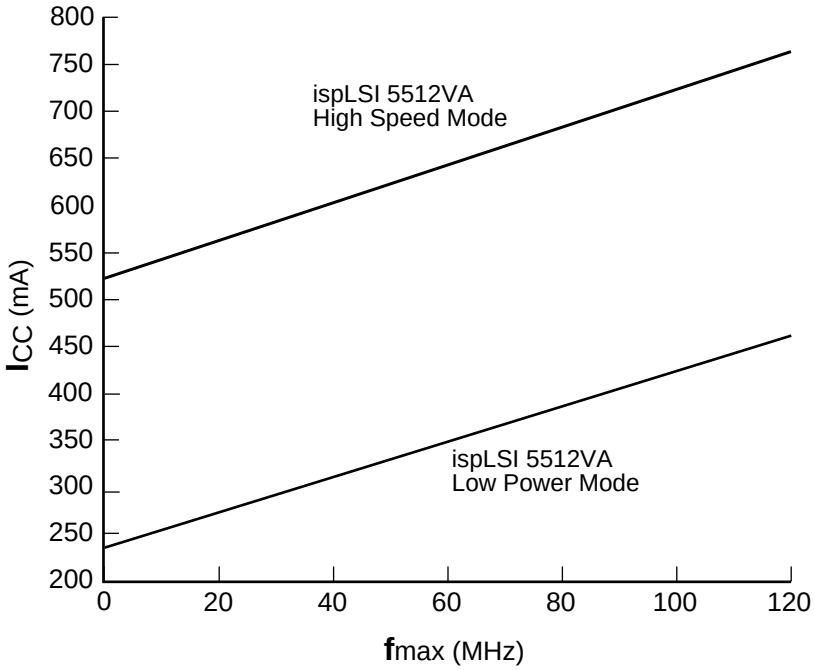
ispLSI 5512VA Timing Model



Power Consumption

Power consumption in the ispLSI 5512VA device depends on two primary factors: the speed at which the device is operating and the number of product terms used. The product terms have a fuse-selectable speed/power tradeoff setting. Each group of four product terms has a single speed/power tradeoff control fuse that acts on the complete group of four. The fast "high-speed" setting operates product terms at their normal full power consumption. For portions of the logic that can tolerate longer propagation delays, selecting the slower "low-power" setting will significantly reduce the power dissipation for these product terms. Figure 10 shows the relationship between power and operating speed.

Figure 10. Typical Device Power Consumption vs fmax



Notes: Configuration of 32 16-bit Counters
Typical Current at 3.3V, 25° C

I_{CC} can be estimated for the ispLSI 5512VA using the following equation:

High Speed Mode: ICC = 70 + (# of PTs * 0.4592) + (# of nets * Max. freq * 0.00391)
Low Power Mode: ICC = 70 + (# of PTs * 0.160) + (# of nets * Max. freq * 0.00391)
# of PTs = Number of Product Terms used in design
# of nets = Number of Signals used in device
Max. freq = Highest Clock Frequency to the device

The I_{CC} estimate is based on typical conditions (V_{CC} = 3.3V, room temperature) and an assumption of 2 GLB loads on average exists. These values are for estimates only. Since the value of I_{CC} is sensitive to operating conditions and the program in the device, the actual I_{CC} should be verified.

Signal Descriptions

Signal Name	Description
TMS	Input - This pin is the Test Mode Select input, which is used to control the JTAG state machine.
TCK	Input - This pin is the Test Clock input pin used to clock through the JTAG state machine.
TDI	Input - This pin is the JTAG Test Data In pin used to load data.
TDO	Output - This pin is the JTAG Test Data Out pin used to shift data out.
TOE / I/O0	Input/Output - This pin functions as either the Test Output Enable pin or an I/O pin based upon customer's design. TOE tristates all I/O pins when a logic low is driven.
GOE0, GOE1	Input - These two pins are the Global Output Enable input pins.
GSET/GRST	Dedicated Set/Reset Input - This pin is available to all registers in the device and can independently be configured as preset, reset or no effect on each register. The global polarity (active high or low input) for this pin is also selectable.
I/O	Input/Output – These are the general purpose I/O used by the logic array.
GND	Ground
NC[1]	No connect.
VCC	Vcc
CLK0, CLK1	Dedicated clock inputs for all registers. Both clocks are muxed before being used as the clock input to all registers in the device.
CLK2 / I/O, CLK3 / I/O	Input/Output - These pins function as either dedicated clock inputs for all registers or an I/O pin based upon customer's design. Both clocks are muxed before being used as the clock input to all registers in the device.
VCCIO	Input - This pin is used if an optional 2.5V output is to be used. Every I/O can independently select either 3.3V or the optional voltage as its output level. If the optional output voltage is not required, this pin must be connected to the Vcc supply. Programmable pull-up resistors and bus-hold latches only draw current from this supply.

1. NC pins are not to be connected to any active signals, VCC or GND.

* I/O 119 is multiplexed with CLK2, I/O 131 is multiplexed with CLK3 and I/O 0 is multiplexed with TOE.

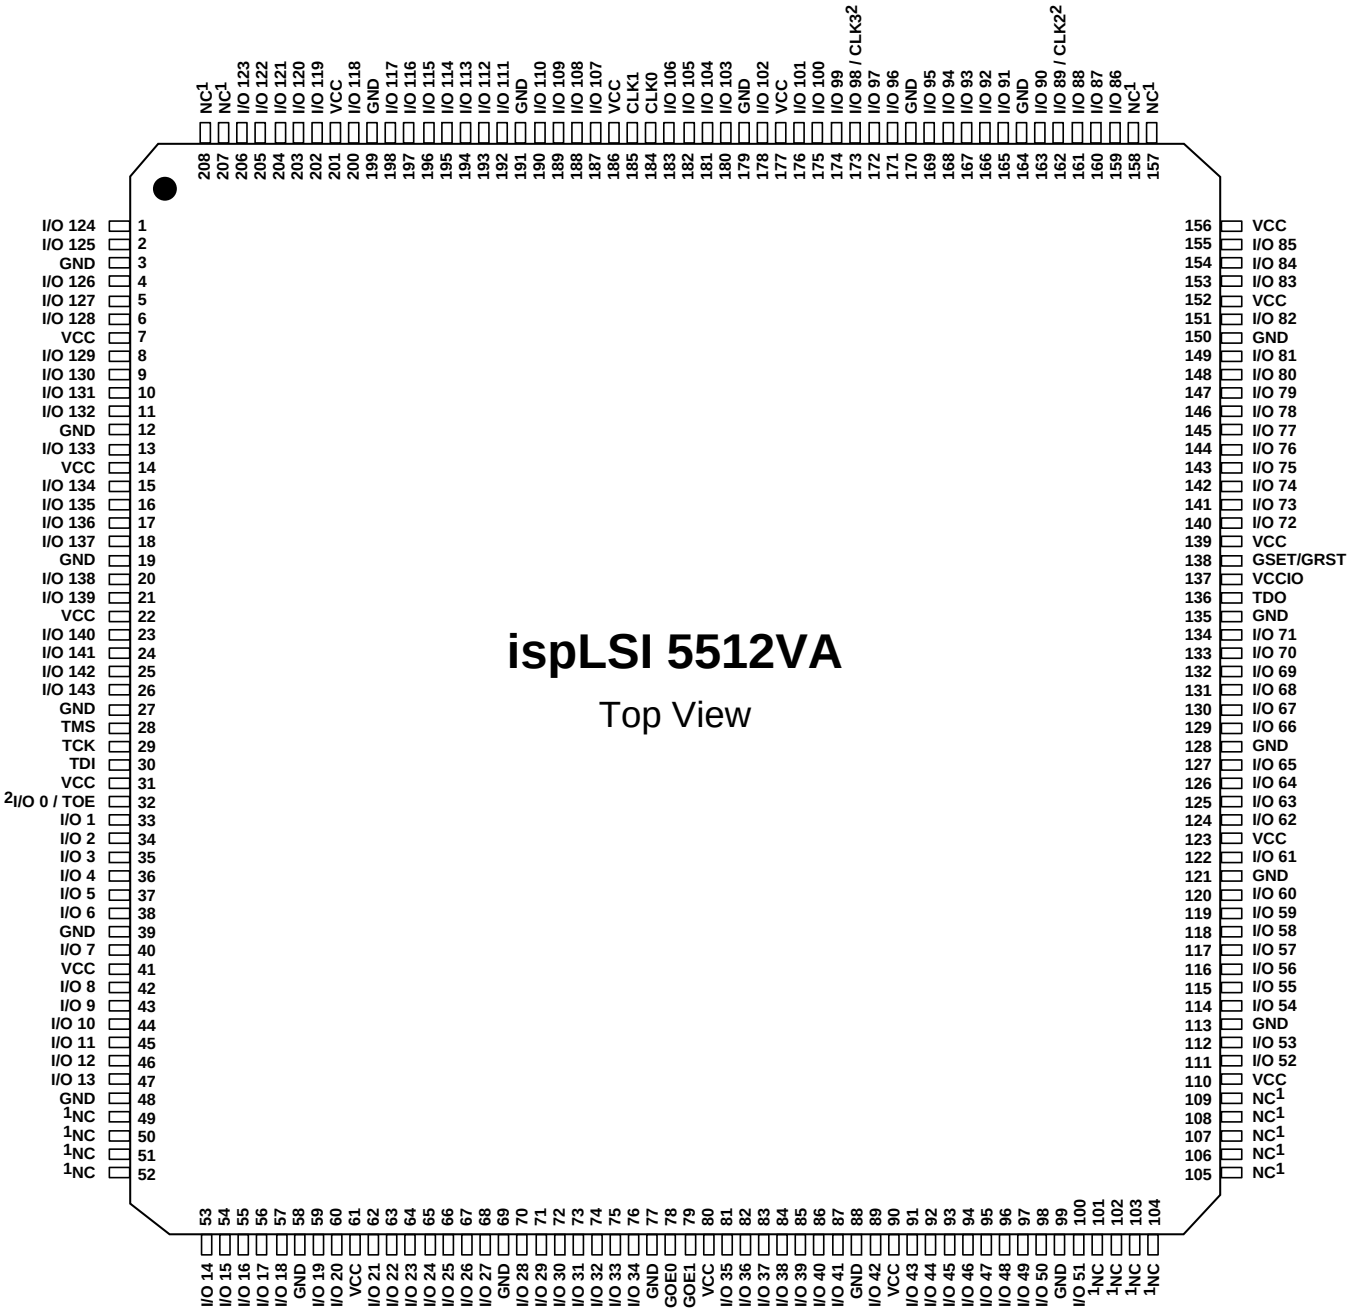
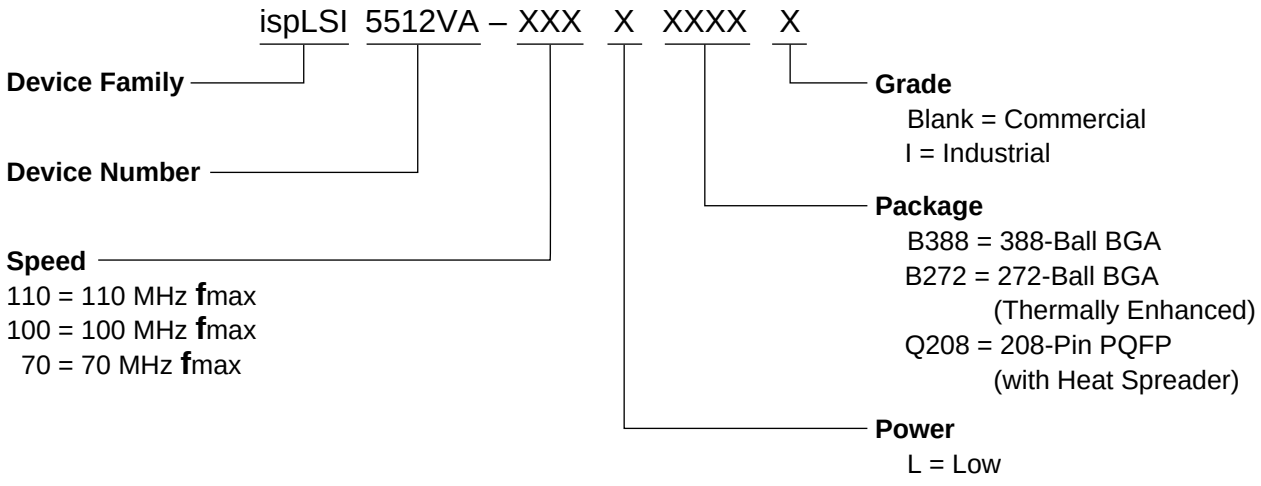
Pin Configuration

ispLSI 5512VA 208-pin PQFP (with Heat Spreader)



1. NC pins are not to be connected to any active signal, Vcc or GND.
2. Pins have dual function capability.

Part Number Description



0212/5512va

littlediode
COMPONENTS FOR ALL

Littlediode supplies new, hard to find or obsolete electronic components and semiconductors all over the world.

With over two million different components listed you are sure to find the part you need.

Feel free to visit us today at our online store:

LittleDiode.com

Looking forward to providing you with the best possible service.
