

M51285BFP

NTSC/PAL ENCODER

DESCRIPTION

The M51285BFP is a semiconductor integrated circuit developed for PIP (picture in picture), digital special playback etc. The circuit, formed on the 42 pin plastic flat package, encodes R-Y, B-Y color signals and luminance signals into video signals, and is usable both in NTSC and PAL systems.

FEATURES

- Low power dissipation (supply voltage: 5V; circuit current: 35mA Typ.)
- Applicable to NTSC and PAL systems
- Chroma level of sub display screen tracks the burst level of main display screen.
- No need to adjust carrier balance
- 4fsc VCXO is adopted for accurate modulation axle.
- Killer level can be set from outside.
- Internal carrier can be modulated with FREE RUN mode.
- Pedestals of main and sub display screens agree.
- Usable for a variety of special playback signal processing patterns

APPLICATION

NTSC/PAL SYSTEM VCR,TV

RECOMMENDED OPERATING CONDITION

Rated supply voltage5.0V

Supply voltage range4.5~5.5V

PIN CONFIGURATION (TOP VIEW)**BLOCK DIAGRAM**

ELECTRICAL CHARACTERISTICS TEST METHOD

AFC

$V_{SDETMIN}$

Observe the SYNC separate out (signal) at PIN ⑨. Decrease the synchronizing signal of SG 1 gradually; the synchronizing signal amplitude when the SYNC separate out (signal) begins to be disturbed is $V_{SDETMIN}$.

$td-csync$

Observe the SYNC separate out (signal) at PIN ⑨ and the synchronizing signal of SG 1 simultaneously, the time difference, shown in the following figure, is $td-csync$.

$W-csync$

Using the same measuring method as in (A-2), the pulse width, shown in the above figure, is $W-csync$.

V_H-sync

The "H" voltage of the SYNC separate out signal observed at PIN ⑨ is V_H-sync .

$tdf-v$

Observing the vertical SYNC separate out (signal) at PIN ⑧ and the vertical synchronizing signal of SG 1 simultaneously, the time difference in the first transition, shown in the following figure, is $tdf-v$.

$tdb-v$

Using the same measuring method as in (A-5), the time difference in the last transition shown, in the following figure, is $tdb-v$.

V_H-V

The "H" voltage of the SYNC separate out (signal) observed at PIN ⑧ is V_H-V .

$td-HD$

Observing the HD output signal of PIN ⑩ and the synchronizing signal of SG 1 simultaneously, the time difference, shown in the following figure, is $td-HD$.

$W-HD$

Using the same measuring method as in (A-8), the pulse width, shown in the above figure, is $W-HD$.

V_H-HD

The "H" voltage of the HD output signal observed at PIN ⑩ is V_H-HD .

CPR_{AFCP}

For SG1, use a pulse wave with constant $P_w=5.0\mu\text{sec}$ and variable frequency, as shown in the figure to the right. The amplitude is 0.28Vp-p . The measuring point is at PIN5. The output voltage of PIN ⑤ is "L" when AFC is locked. The pulse frequency when the output of PIN ⑤ changes from "H" to "L" as the frequency is decreased gradually from around 20kHz is f_H , and CAR_{AFCP} is expressed as follows.

$$\text{CAR}_{\text{AFCP}} = \begin{cases} f_H - 15.734[\text{kHz}] & (\text{NTSC}) \\ f_H - 15.625[\text{kHz}] & (\text{PAL}) \end{cases}$$

CPR_{AFCN}

Use the same measuring method given in (A-11). In this case, decrease the frequency gradually from around 10kHz ; the pulse frequency when the output of PIN ⑤ changes from "H" to "L" is f_L , and CPR_{AFCN} is expressed as:

$$\text{CPR}_{\text{AFCN}} = \begin{cases} 15.734 - f_L [\text{kHz}] & (\text{NTSC}) \\ 15.625 - f_L [\text{kHz}] & (\text{PAL}) \end{cases}$$

V_{H-SDET}

The output DC voltage of PIN ⑤ when the output of SG1 carries no signal is V_{H-SDET} .

V_{L-SDET}

The output DC voltage of PIN ⑤ when SG1 is the standard video signal is V_{L-SDET} .

PLL

V_{CLK-MIN}

First, adjust the free running frequency. Set SW2 to 2 and vary TC1 while measuring the output frequency of PIN③ (high impedance buffer is necessary) in order to adjust it to 3.579545MHz for NTSC or 4.43619MHz for PAL.

After adjusting the free running frequency, return SW2 to 1. While decreasing the burst signal amplitude of SG4 gradually, the burst signal amplitude right before the burst signal and VCXO output signal of PIN ⑩ step out is $V_{\text{CLK-MIN}}$.

CPR_{APCP}

After adjusting the free running frequency by the method given in (P-1), make sure SW2 has been returned to 1. Use continuous sine waves as the signal source for SG4 whose amplitude is 280mVp-p . The frequency when APC is locked

by gradually decreasing the frequency from approximately the free running frequency $+5\text{kHz}$ is f_H , and CPR_{APCP} is expressed as:

$$\text{CPR}_{\text{APCP}} = \begin{cases} f_H - 3579545 [\text{Hz}] & (\text{NTSC}) \\ f_H - 4433619 [\text{Hz}] & (\text{PAL}) \end{cases}$$

CPR_{APCL}

The frequency when APC is locked by gradually increasing the frequency from the free running frequency -5kHz using the same method given in (P-2) is f_L , and CPR_{APCL} is expressed as:

$$\text{CPR}_{\text{APCL}} = \begin{cases} 3579545 - f_L [\text{Hz}] & (\text{NTSC}) \\ 4433619 - f_L [\text{Hz}] & (\text{PAL}) \end{cases}$$

V_{KILLER}

After adjusting the free running frequency by the same method given in (P-1), return SW2 to 1. Set VS1 to 2.5V and gradually decrease the burst signal amplitude of SG4. The burst signal amplitude right before the output DC voltage of PIN② changes from "L" to "H" is V_{BMIN} [mVp-p], and V_{KILLER} is expressed as:

$$V_{\text{KILLER}} = 20 \log \frac{V_{\text{BMIN}}}{280 [\text{mVp-p}]}$$

V_{H-KILL}

While following the method given in (P-4), when the burst signal amplitude of SG4 becomes 0mVp-p , the DC voltage of PIN ② is V_{H-KILL} .

V_{L-KILL}

While following the method given in (P-4), when the burst signal amplitude of SG4 becomes 280mVp-p , the DC voltage of PIN ② is V_{L-KILL} .

f_o

This parameter is a measure of the dispersion of free running frequency when TC 1 is fixed after adjusting VCXO free running frequency. When $\text{TC1}=17\text{pF}$ for NTSC or 21pF for PAL, and SW2 is set to 2, the frequency at PIN③ is f_o .

V_{TH-HD}

This parameter indicates the pulse voltage of external HD pulses (PIN ②) for normal operation of F/F of IC in PAL. The "H" voltage of HD pulses should be MAX or higher and the "L" voltage should be MIN or lower.

V_{TH-NP}

NTSC mode becomes active if the voltage of PIN② becomes $V_{\text{TH-NP}}$ or higher. Therefore, it is necessary that the voltage of PIN② be MAX or higher in NTSC, or that the "H" voltage of HD pulses in PAL be MIN or lower.

MOD

G_{MOD}

To measure R-Y input, set SW4 to 2, SW2 to 2, and SW10 to 1. To measure B-Y input, set SW6 to 2, SW2 to 2, and SW10 to 1. Input the waveforms shown in the following figure from SG5 and SG11 respectively, and read V_o from the waveform observed at TP33. Calculate G_{MOD} is given by the following expression.

$$G_{MOD} = \frac{V_o [V_{p-p}]}{0.5 [V_{p-p}]}$$

A_{BF-MOD}

To measure R-Y B.F.P. input, set SW5 to 2, SW2 to 2, and SW10 to 1. To measure B-Y B.F.P. input, set SW7 to 2, SW2 to 2, and SW10 to 1. Input the waveforms shown in the following figure from SG6 and SG11 respectively, and measure A_{BF-MOD} from the waveform observed at TP33.

D_{MOD}

Under the same measuring conditions given in (M-1), increase the amplitude of SG5 gradually; the amplitude of SG5 right before the output of TR3 reaches saturation is D_{MOD} .

L_{KMOD}

Set SW2 to 2 and SW10 to 1, and input the waveform shown in the following figure from SG11; the output amplitude measured at TP33 is L_{KMOD} .

TR

Set SW5 to 2 and SW10 to 1, and input the waveforms Δ shown in the following figure from SG4, SG5 and SG11 respectively. The amplitude of the waveform observed at TP33 is V_{140} when $V_A=140mV_{p-p}$, and V_{280} when $V_A=280mV_{p-p}$; TR is given by the following expression.

$$TR = \frac{V_{280}}{V_{140}}$$

θ_{MOD}

The measure of the phase of the burst equivalent signal of SG4 is θ_{deg} . Set SW10 to 1 and input the waveforms Δ shown in the following figure from SG5, SG7 and SG11. The phase at TP33 when SW4 is set to 2 is θ_1 , and the phase at TP33 when SW4 is set to 1 and SW6 to 2 is θ_2 . θ_{MOD} is given by the following expression.

Y/C MIX, Video SW

dVsync

Input 280mVp-p sink from SG1 as shown in the following figure. Measure the p-p value of the sink waveform after the clamp condenser, and the difference between it and the input is dVsync.

Gvsub

The output p-p value of PIN ④ when SW1 is set to 2 and a 1.0Vp-p, setup 0.75% color bar composite video signal is input from SG2 is V_{42OUT} . Gvsub is given by the following expression.

$$G_{vsub} = 20 \log \frac{V_{42OUT}}{1.0} \text{ [dB]}$$

Gvmain

The output p-p value of PIN ④ when a 1.0Vp-p 100% white Y video signal is input from SG1 is V_{38OUT} . Gvmain is given by the following expression.

$$G_{vmain} = 20 \log \frac{V_{38OUT}}{1.0} \text{ [dB]}$$

VFRAME

Set SW1 to 2, SW11 to 2, input the waveforms shown in the following figure from SG1 and SG2 respectively, and measure VFRAME of the waveform output from PIN ④ as shown below.

Vsync

Measure the p-p value of the sink pulse output at PIN ④ under the same measuring conditions given in (V-1); the value obtained is Vsync.

Gvmix

Input a waveform under the same conditions given in (V-1) from SG1 and set SW12 to 2, and SW8 and SW9 to 1. The p-p value of the composite video signal output to PIN ④, when a Y signal that is an attenuated signal of a 1.0Vp-p 75% color bar video signal synchronized with SG1 at -12dB is input from SG11 and a chroma signal that is an attenuated signal of the above color bar video signal at -12dB is input from SG9, is V_{38OUT} [Vp-p]. Gvmix is given by the following expression.

$$G_{vmix} = 20 \log \frac{V_{38OUT}}{0.5} \text{ [dB]}$$

Dvmix

Input a waveform under the same conditions given in (V-1) from SG1, set SW12 to 2 and SW9 to 1, and input a luminance signal synchronized with SG1 from SG11. The amplitude of the input when the output of PIN ④ begins to be distorted as the amplitude is increased is Dvmix.

Dcmix

Input a waveform under the same conditions given in (V-1) from SG1, set SW12 to 2 and SW8 to 1, and input a chroma signal synchronized with SG1 from SG10. The amplitude of the input when the output of PIN ④ begins to be distorted as the amplitude is increased is Dcmix.

V_{OF-PED}

Input a waveform under the same conditions given in (V-1) from SG1, change SW12 according to the timing shown below. Measure the part of the waveform output at PIN ③ as shown below. The measurement obtained is V_{OF-PED}.

Entire Circuit

V_{ccR}

Operation should be normal, matching the application circuit example given.

I_{cc}

The current flowing into PIN ③ in the application circuit example is I_{cc}.

TEST CIRCUIT

(Note) SWs 1 through 12 should be connected as conditioned in this circuit diagram unless they are otherwise specified in the measuring methods. SG1 and SG2 are both 1.0 V_{P-P} 100% white Y signals, and SG4 is 280 mV_{P-P} chroma burst signal source synchronizing with SG1.

TYPICAL CHARACTERISTICS

6249826 0021171 657

APPLICATION EXAMPLE

* Input to pins ②, ③ and ④ should be provided at sufficiently low impedance.

PRECAUTIONS FOR APPLICATION

ID detection level is linked with KILLER LEVEL adjustment at pin ②. For stable operation of ID in the PAL mode, KILLER LEVEL should be kept under 2.8V. For the use in the free run mode in PAL, the application circuit shown here is recommended
