

8 STAGE PRESETTABLE SYNCHRONOUS DOWN COUNTERS

- **HIGH SPEED**
 $f_{MAX} = 40 \text{ MHz (TYP.) at } V_{CC} = 5 \text{ V}$
- **LOW POWER DISSIPATION**
 $I_{CC} = 4 \mu\text{A (MAX.) at } T_A = 25^\circ\text{C}$
- **HIGH NOISE IMMUNITY**
 $V_{NIH} = V_{NIL} = 28 \% V_{CC} \text{ (MIN.)}$
- **OUTPUT DRIVE CAPABILITY**
 10 LSTTL LOADS
- **SYMMETRICAL OUTPUT IMPEDANCE**
 $|I_{OH}| = I_{OL} = 4 \text{ mA (MIN.)}$
- **BALANCED PROPAGATION DELAYS**
 $t_{PLH} = t_{PHL}$
- **WIDE OPERATING VOLTAGE RANGE**
 $V_{CC} \text{ (OPR)} = 2 \text{ V to } 6 \text{ V}$
- **PIN AND FUNCTION COMPATIBLE WITH**
 40102B/40103B

DESCRIPTION

The M54/74HC40102/40103 are high speed CMOS 8-STAGE PRESETTABLE SYNCHRONOUS DOWN COUNTERS fabricated with silicon gate C²MOS technology. They achieve the high speed operation similar to equivalent LSTTL while maintaining the CMOS low power dissipation.

The HC40102, and HC40103 consist of an 8-stage synchronous down counter with a single output which is active when the internal count is zero. The HC40102 is configured as two cascaded 4-bit BCD counters, and the HC40103 contains a single 8-bit binary counter. Each type has control inputs for enabling or disabling the clock, for clearing the counter to its maximum count, and for presetting the counter either synchronously or asynchronously. All control inputs and the CARRY-OUT/ZERO-DETECT output are active-low logic. In normal operation, the counter is decremented by one count on each positive transition of the CLOCK. Counting is inhibited when the CARRY-IN/COUNTER ENABLE ($\overline{CI/CE}$) input is high. The CARRY-OUT/ZERO-DETECT ($\overline{CO/ZD}$) output goes low when the count reaches zero if the $\overline{CI/CE}$ input is low, and remains low for one full clock period. When the SYNCHRONOUS PRESET-ENABLE (SPE) input is low, data at the J input is clocked into the counter on the next positive clock transition regardless of the state of the $\overline{CI/CE}$ input.

PIN CONNECTIONS (top view)

DESCRIPTION (Continued)

When the ASYNCHRONOUS PRESET-ENABLE ($\overline{\text{APE}}$) input is low, data at the J inputs is asynchronously forced into the counter regardless of the state of the $\overline{\text{SPE}}$, $\overline{\text{CI/CE}}$, or CLOCK inputs. J Inputs J0-J7 represent two 4-bit BCD words for the HC40102 and a single 8-bit binary word for the HC40103. When the CLEAR ($\overline{\text{CLR}}$) input is low, the counter is asynchronously cleared to its maximum count (99₁₀ for the HC40102 and 255₁₀ for the HC40103 regardless of the state of any other input. The precedence

relationship between control input is indicated in the truth table. If all control inputs are high at the time of zero count, the counters will jump to the maximum count, giving a counting sequence of 100 pr 256 clock pulses long. The HC40102 and HC40103 may be cascaded using the $\overline{\text{CI/CE}}$ input and the $\overline{\text{CO/ZD}}$ output, in either a synchronous or ripple mode. All inputs are equipped with protection circuits against static discharge and transient excess voltage.

TRUTH TABLE

CONTROL INPUTS				MODE	FUNCTIONAL DESCRIPTION
CLEAR	APE	SPE	CI/CE		
H	H	H	H	COUNT INHIBIT	EVEN IF CLOCK IS GIVEN, NO COUNT IS MADE
H	H	H	L	REGULAR COUNT	DOWN COUNT AT RISING EDGE OF CLOCK
H	H	L	X	SYNCHRONOUS PRESET	DATA OF PI TERMINAL IS PRESET AT RISING EDGE OF CLOCK
H	L	X	X	ASYNCHRONOUS PRESET	DATA PF PI TERMINAL IS ASYNCHRONOUSLY PRESET TO CLOCK
L	X	X	X	CLEAR	COUNTER IS SET TO MAXIMUM COUNT

X: DON'T CARE - MAXIMUM COUNT: "99" FOR HC40102 AND "255": FOR HC40103

PIN DESCRIPTION

PIN No	SYMBOL	NAME AND FUNCTION
1	CLOCK	CLOCK Input (LOW to HIGH edge triggered)
2	$\overline{\text{CLEAR}}$	Asynchronous Master Reset Input (Active LOW)
3	$\overline{\text{CI/CE}}$	Terminal Enable Input
4, 5, 6, 7, 10, 11, 12, 13	J0 to J9	Jam Inputs
9	$\overline{\text{APE}}$	Asynchronous Preset Enable Input (Active LOW)
14	$\overline{\text{CO/ZD}}$	Terminal Count Output (Active LOW)
15	$\overline{\text{SPE}}$	Synchronous Preset Enable Input (Active LOW)
8	GND	Ground (0V)
16	V _{CC}	Positive Supply Voltage

INPUT AND OUTPUT EQUIVALENT CIRCUIT

IEC LOGIC SYMBOLS

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V _{CC}	Supply Voltage	-0.5 to +7	V
V _I	DC Input Voltage	-0.5 to V _{CC} + 0.5	V
V _O	DC Output Voltage	-0.5 to V _{CC} + 0.5	V
I _{IK}	DC Input Diode Current	± 20	mA
I _{OK}	DC Output Diode Current	± 20	mA
I _O	DC Output Source Sink Current Per Output Pin	± 25	mA
I _{CC} or I _{GND}	DC V _{CC} or Ground Current	± 50	mA
P _D	Power Dissipation	500 (*)	mW
T _{stg}	Storage Temperature	-65 to +150	°C
T _L	Lead Temperature (10 sec)	300	°C

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these condition is not implied.

(*) 500 mW: ≡ 65 °C derate to 300 mW by 10mW/°C: 65 °C to 85 °C

RECOMMENDED OPERATING CONDITIONS

		4.5			12	19		24		29	
		6.0			10	16		20		24	
f _{MAX}	Propagation Delay Time	2.0			4	8		3		2.6	pF
		4.5			20	32		16		13	
		6.0			24	38		19		15	
C _{IN}	Input Capacitance				5	10		10		10	pF
C _{PD} (*)	Power Dissipation Capacitance				60						pF

(*) C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. $I_{CC(opr)} = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC}$

TEST CIRCUIT I_{CC} (Opr.)

The contents of count jump to maximum count (99 for the HC40102 and 225 for the HC40103) if clock is given when the readout is "0". Therefore, operation of 100-frequency division and that of 256-frequency division are carried out for the HC40102 and HC40103, respectively, when clock input alone is given without various kinds of preset operation.

PRESET OPERATION AND RESET OPERATION

When Clear ($\overline{\text{CLEAR}}$) input is set to the "L" level, the readout is set to the maximum count independently of other inputs. When Asynchronous Preset Enable ($\overline{\text{APE}}$) input is set to the "L" level, readouts given on J0 to J7 can be preset asynchronously to counter independently of inputs other than $\overline{\text{CLEAR}}$ input. When Synchronous Preset Enable ($\overline{\text{SPE}}$) is set to the "L" level, the readouts given on J0 to J7 can be preset to counter synchronously with the rise of clock.

As to these operation modes, refer to the truth table.

The diagram shows a J-K flip-flop implemented using a D flip-flop. The J and K inputs are connected to the D flip-flop's D input through a network of gates. The clock input (CK) is connected to the D flip-flop's clock input (CK). The output (Q) is connected to the D flip-flop's Q output. The circuit also includes a clear input (CLR) and a set input (SPE).

EXAMPLE OF TYPICAL APPLICATION

PROGRAMMABLE DIVIDE-BY-N COUNTER

$$f_{OUT} = \frac{f_{IN}}{N+1}$$

- Timing chart when N = "3"
(J0, J1 = V_{CC}, J2 - J7 = GND)

- HC40102... 1/2 to 1/100 are dividable
- HC40103... 1/2 to 1/256 are dividable

PARALLEL CARRY CASCADING

* At asynchronous cascade connection, huzzerd occurs at CO output after its second stage when digit place changes, due to delay arrival. Therefore, take gate from HC32 or the like, not from CO output at the rear stage directly.

PROGRAMMABLE TIMER

$$t_W = \left(\frac{N}{f_{IN}} + t_s \right)$$

Note : The above formula does not take into account the phase of clock input. Therefore, the real pulse width is the distance between the above formula-1/f_{IN} ~ the above formula.
