

DESCRIPTION

The MD1620F is a high-efficiency step down DC-DC converter power integrated circuit with main MOSFET switch and Schottky Barrier Diode. MD1620F can deliver 10watts maximum (5V, 2.0V) with high efficiency over a wide input voltage range. With the MD1620F you can construct a complete DC-DC converter using only a few external components. Featuring an HSOP 28 pin surface mount package, the MD 1620F allows you to incorporate a very small and thin power supply on your circuit board.

PIN ASSIGNMENT

- **Vref** - Temperature compensated internal voltage. You can pull 1mA maximum for external circuit.
- **OSC** - MD1620F uses internal oscillator without external component. Frequency (Saw tooth wave form) is trimmed to 250kHz on chip.
- **Error Amp** - Error Amp detects output voltage of DC-DC converter and controls PWM signal. You can adjust the loop gain when you connect feedback resistor and capacitor between ampOUT and Amp (-). It will provide stable phase compensation.
- **Overcurrent protection** - MD1620F uses pulse-by-pulse current protection. Current will be sensed voltage drop of external current sensing resistor. Threshold of OCL is 0.19V.
