DESCRIPTION

The STV5347 decoder is a computer-controlled teletext device including a 4 page internal memory. Data slicing and capturing extracts the teletext information embedded in the composite video signal. Control is accomplished via a two wire serial I²C bus ®. Internal ROM provides a character set suitable to display text using up to seven national languages. Different ROM versions will support several national character sets. Hardware and software features allow selectable master/slave synchronization configurations. The STV5347 also supports facilities for reception and display of current level protocol data.

FUNCTIONAL DESCRIPTION

I - Displayable Page Memory Map

The organization of a page-memory is shown in Figure 6.

The display area consists of 25 rows of 40 characters per row.

The organization is as follows :

- Row zero contains the page header :
 - The first seven characters (0 - 6) are used for messages regarding the operational status.
 - The eighth character is an alphanumeric control character either "white" or "green" defining the "search" status of the page. When it is "white" the operational state is normal and the header appears white ; when it is "green" the opera-

tional state corresponds to the "search mode" and the header appears green.

- The following twenty-four characters give the header of the requested page when the system is in search mode.
- The last eight characters display the time of day.

- Row number twenty-four is used by the microprocessor for the display of information, or used to display X/24 colored key data according to R0D7 bit.

- Row twenty-five comprises ten bytes of control data concerning the received page (see Table 1) and fourteen free bytes which can be used by the microprocessor.

Figure 6 : Page Memory Organization

FUNCTIONAL DESCRIPTION (continued)**II - X/24, X/27, 8/30 Reading**

The X/24, X/27, 8/30 packets can be read when bit D2 (8/30 select) of register R8 is set.

X/24 is read at equivalent row address 20 when bit D7 of R0 is cleared.

X/27/0 is read at equivalent row address 16.

8/30/0,1 are read at equivalent row address 23

when bit D1 = 0 and bit D0 = 0 in register R8.

8/30/2,3 are read at equivalent row address 23 when bit D1 = 0 and bit D0 = 1 in register R8.

The X/24, X/27, 8/30 packets of the selected pages are stored when bit D4 (X/24, X/27, 8/30 enable) of register 1 is set.

FUNCTIONAL DESCRIPTION (continued)
III - I²C Bus Register Map (see Table 2)

Registers R0 to R10 are write only whilst R11A is a read/write and R11B is a read only register respect to the microprocessor.

The automatic succession on a byte basis is indicated by the arrows in Table 2.

In the normal operating mode TB should be set to logic level 0.

After power-up the contents of the registers are as

follows : all bits in registers R0 to R11A are cleared to zero with the exception of bits D0 and D1 in registers R5 and R6 which are set to logical one.

After power-up all the memory bytes are preset to hexadecimal value 20H (space) with the exception of the byte corresponding to row 0 of column 7 of chapter 0 which is set to the value corresponding to "alpha white" hexadecimal value 07H.

		$\overline{\text{DEW}}$ / FULLFIELD (D3)	Selection of field flyback mode or full channel mode (D3 = 1) for recovering of Teletext data.
		X/24, X/27, 8/30 ENABLE	Enables capture of X/24, X/27, 8/30 packets
		$\overline{\text{ACQUISITION}}$ ON / OFF (D5)	Control of acquisition operation (D5 = 0 enables acquisition)
		7 bits + parity or 8 bits without parity (D6)	Selection of received data format either 7 bits with parity (D6 = 0) or 8 bits without parity (D6 = 1).
R2 Address 02H	Addressing information for a page request	SC0, SC1, SC2 (D0, D1, D2)	Address the first column of the on chip page request RAM to be written.
		TB (D3)	Test bit equal to "0" in the normal working mode.
		A0, A1 (D4, D5)	Address a group of four consecutive pages currently used for data acquisition.
R3 Address 03H	Data relative to the requested page (see Table 3)	PRD0 - PRD4 (D0 - D4)	Written data in the page request RAM, starting with the columns addressed by SC0, SC1, SC2.
R4 Address 04H	Selection of one of four pages to display	A0, A1 (D0, D1)	These 2 bits correspond to the logical states of the 2 address lines (A10, A11) during memory read cycles.
R5 Address 05H	Display control for normal operation	PON (D0, D1)	Picture on (IN: D0, OUT: D1)
		TEXT (D2, D3)	Text on (IN: D2, OUT: D3)
		$\overline{\text{COR}}$ (D4, D5)	Contrast reduction on (IN: D4, OUT: D5)
		BKGND (D6, D7)	Background color on (IN: D6, OUT: D7)

III.1 - Register Functions (continued)

Register	Function	Bit(s)	Description
R7 Address 07H	Display mode	BOX ON 0, 1-23, 24 (D0, D1, D2)	The "boxing" function is enabled on row 0, 1-23 and 24 by D0, D1 and D2 set to one.
		$\overline{\text{TOP}}$ / BOTTOM Single / Double Height (D4/D3)	x0 = Normal 01 = double height Rows 0 to 11 11 = double height Rows 12 to 23
		Conceal / Reveal (D5)	Conceal Reveal Function
		Cursor ON/OFF (D6)	Cursor position given by row/column value of R9/R10
		$\overline{\text{STATUS ROW}}$ BTM / TOP (D7)	The row 24 is displayed before the "Main text Area" (lines 0-23) or after (D7 = 0).
R8 Address 08H	Page selection	Page Selection A0 (D0), A1 (D1)	Page memory selection
		X/24, X/27, 8/30 Select (D2)	D2 = 1 allows access to equivalent rows 16, 20, 23 to read X/27, X/24, 8/30 packets.
		CLEAR MEM (D3)	The selected pages are feed with 20H code (space) to clear data.
R9 to R11A Address 09H to 0BH*	Active row address (R9), active column address (R10). Data contained in R11A read (written) from (to) memory by microprocessor via I ² C.		
R11B Address 0BH*	Status	VCS QUAL (D0)	Good VCS quality signal detected (D0 = 1) or disturbance (D0 = 0)
		60Hz (D7)	VCS received with 60Hz frequency (D7 = 1) or 50Hz (D7 = 0). Valid only when if good V _{CS} (D0 = 1)

* Reading of R11A or R11B is determined by register 0, bit D0. Nevertheless, write operation is always performed on R11A register.

Table 3 : Register R3

5	Do care minutes tens	X	MT2	MT1	MT0
6	Do care minutes units	MU3	MU2	MU1	MU0

The abbreviations have the same significance as in Table 1 with the exception of the "DO CARE" entries. It is only when this bit is "1" that the corresponding digit is taken into consideration on page request. For example, a page defined as "normal" or one defined as "timed" may be selected.

If $\overline{\text{HOLD}}$ is low the page is held. The addressing of successive bytes via the I²C is automatic.

IV - Character Sets

The complete character set with 8-bit decoding is given in Table 4.

Characters in columns 0 and 1 are normally displayed as blanks. Black dots represent the character shape whereas white dots represent the background.

Each character can be identified by a pair of corre-

sponding row and column integers : for example the character "3" may be indicated by 3/3.

A rectangle may be represented as follows : ☐

The characters 8/6, 8/7, 9/5, 9/7 are used as special characters, always in conjunction with 8/5.

The 13 national characters are placed in columns with bit 8 = 0.
