Note P_{in(0.1 dB)} or P_{in(1 dB)} is measured the input power level when the insertion loss increase more 0.1 dB or 1 dB than that of linear range. All other characteristics are measured in linear range.

Cautions 1. When the μPG2008TB is used it is necessary to use DC blocking capacitors for No.1 (OUT1), No.3 (OUT2) and No.5 (IN). The value of DC blocking capacitors should be chosen to accommodate the frequency of operation, bandwidth, switching speed and the condition with actual board of your system.

The range of recommended DC blocking capacitor value is less than 100 pF.

2. The distance between IC's GND pin and ground pattern of substrate should be as shorter as possible to avoid parasitic parameters.
