

## HIGH SIDE SMART POWER SOLID STATE RELAY

TYPE	V <sub>DSS</sub>	R <sub>DS(on)</sub>	I <sub>OUT</sub>	V <sub>CC</sub>
VN20AN	60 V	0.05 Ω	33 A	36 V

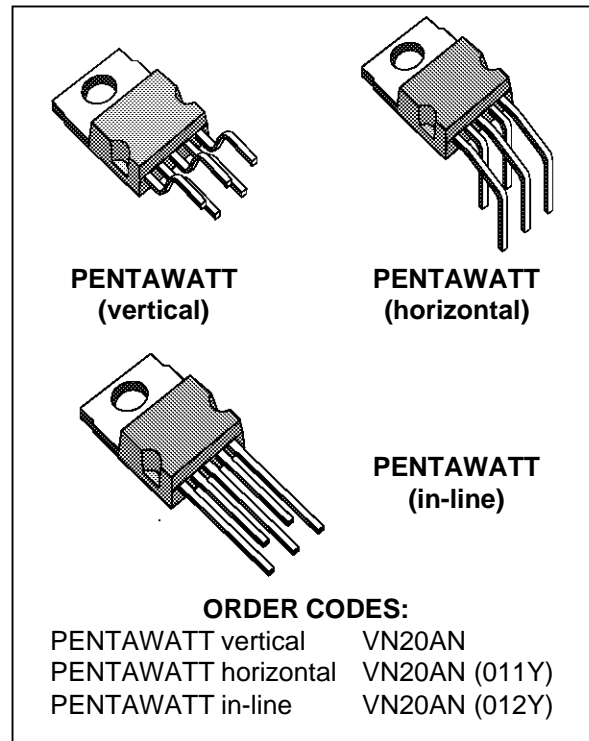

- OUTPUT CURRENT (CONTINUOUS):  
33A @ T<sub>c</sub>=25°C
- LOGIC LEVEL 5V COMPATIBLE INPUT
- THERMAL SHUT-DOWN
- UNDER VOLTAGE PROTECTION
- OPEN DRAIN DIAGNOSTIC OUTPUT
- FAST DEMAGNETIZATION OF INDUCTIVE LOAD

### DESCRIPTION

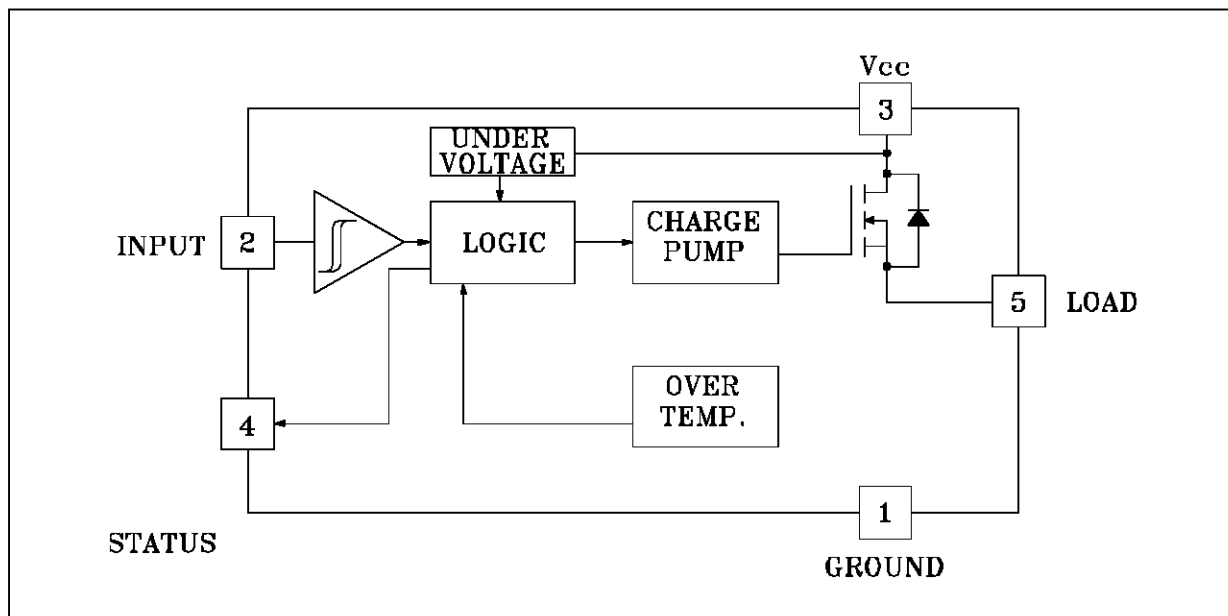

The VN20AN is a monolithic device made using SGS-THOMSON Vertical Intelligent Power Technology, intended for driving resistive or inductive loads with one side grounded.

Built-in thermal shut-down protects the chip from over temperature and short circuit. The diagnostic output indicates an over temperature status.

Fast turn-off of inductive load is achieved by negative (-18V) load voltage at turn-off.

### WAVEFORMS

## FUNCTIONAL DESCRIPTION

The device has a diagnostic output which indicates over temperature conditions.

The truth table shows input, diagnostic output status and output voltage level in normal operation and fault conditions. The output signals are processed by internal logic.

To protect the device against short circuit and over current conditions, the thermal protection turns the integrated Power MOS off at a minimum junction temperature of 140 °C. When the temperature returns to 125 °C the switch is automatically turned on again. To ensure the protection in all  $V_{CC}$  conditions and in all the junction temperature range it is necessary to limit the voltage drop across Drain and Source (pin 3 and 5) at 28V according to:

$$V_{ds} = V_{CC} - I_{OV} * (R_i + R_w + R_l)$$

where:

$R_i$  = internal resistance of Power Supply

$R_w$  = Wires resistance

$R_l$  = Short Circuit resistance

Driving inductive loads, an internal function of the device ensures the fast demagnetization with typical voltage ( $V_{demag}$ ) of -18V.

This function allows the reduction of the power dissipation according to the formula:

$$P_{dem} = 0.5 * I_{load} * (I_{load})^2 * [(V_{CC} + V_{dem})/V_{dem}] * f$$

where  $f$  = Switching Frequency

Based on this formula it is possible to know the value of inductance and/or current to avoid a thermal shut-down.

## PROTECTING THE DEVICE AGAINST REVERSE BATTERY

The simplest way to protect the device against a continuous reverse battery voltage (-36V) is to insert a Schottky diode between pin 1 (GND) and ground, as shown in the typical application circuit (Fig. 3). The consequences of the voltage drop across this diode are as follows:

If the input is pulled to power GND, a negative voltage of  $-V_f$  is seen by the device. ( $V_{il}$ ,  $V_{ih}$  thresholds and  $V_{stat}$  are increased by  $V_f$  with respect to power GND).

The undervoltage shut-down level is increased by  $V_f$ .

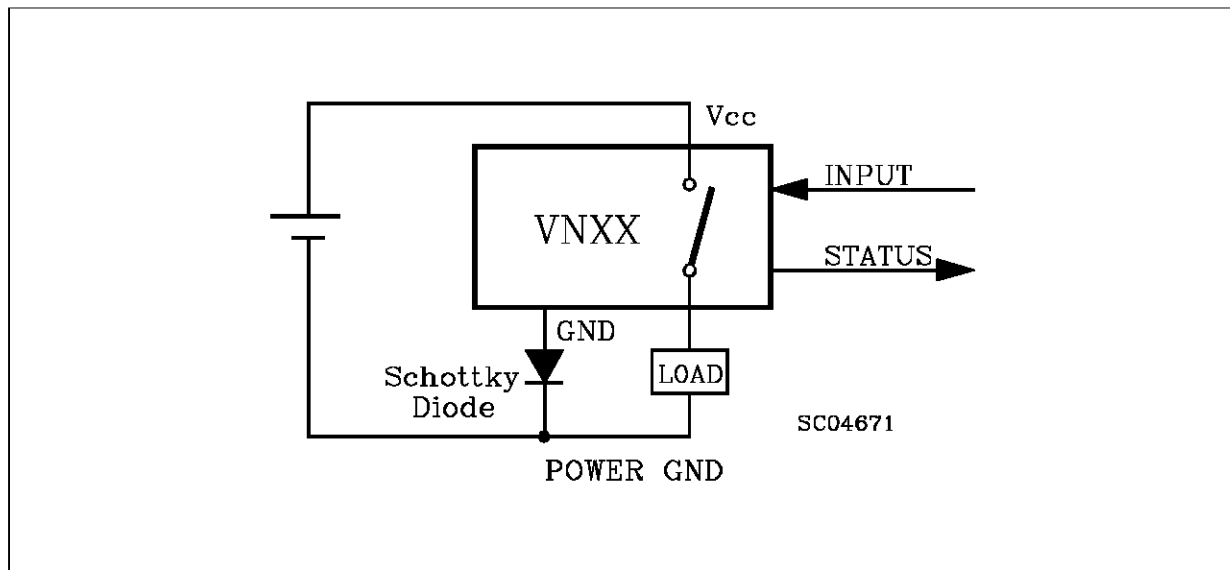

If there is no need for the control unit to handle external analog signals referred to the power GND, the best approach is to connect the reference potential of the control unit to node [1] (see application circuit in fig. 4), which becomes the common signal GND for the whole control board avoiding shift of  $V_{ih}$ ,  $V_{il}$  and  $V_{stat}$ . This solution allows the use of a standard diode.
