LOW-DROPOUT REGULATORS **— HIGH EFFICIENCY**

Dwg. PS-021-6

*BYPASS (fixed regulators) or
ADJUST (A8405SLH-ADJ only).

ABSOLUTE MAXIMUM RATINGS

Input Voltage, V_I	7 V
Peak Output Current, I_{OM}	200 mA*
Enable Input Voltage, V_E	V_I
Operating Temperature Range, T_A	-20°C to +85°C
Junction Temperature, T_J	+150°C
Storage Temperature Range, T_S	-40°C to +150°C

* Output current rating is limited by input voltage, duty cycle, and ambient temperature. Under any set of conditions, do not exceed a junction temperature of +150°C. See following pages.

Designed specifically to meet the requirement for extended operation of battery-powered equipment such as cordless and cellular telephones, the A8405SLH voltage regulators offer the reduced dropout voltage and quiescent current essential for maximum battery life. Applicable also to palmtop computers and personal data assistants, these devices deliver a regulated output at up to 200 mA (transient), which is internally limited, providing short-circuit protection. Regulated output voltages of 2.7, 2.8, 3.0, 3.2, 3.3, 3.6, 3.8, 4.0, and 5.0 V are currently provided. Other voltages, down to 2.0 volts, are available on special order.

A PMOS pass element provides a typical dropout voltage of only 100 mV at 100 mA of load current. The low dropout voltage permits deeper battery discharge before output regulation is lost. Quiescent current does not increase significantly as the dropout voltage is approached, an ideal feature in standby/resume power systems where data integrity is crucial. Regulator accuracy and excellent temperature characteristics are provided by a bandgap reference. The A8405SLH includes an ENABLE input to give the designer complete control over power up, standby, or power down.

These devices are supplied in a thermally enhanced 5-lead small-outline plastic package similar to the SOT-23, and fitting the SC-74A footprint. All devices are rated for operation over a temperature range of -20°C to +85°C.

FEATURES AND BENEFITS

- High Efficiency Provides Extended Battery Life
- 100 mV Typical Dropout Voltage at $I_O = 100$ mA
- 80 μ A Typical Quiescent Current
- Low Output Noise
- 200 mA Current-Limited Output
- Improved PSRR and Transient Performance

APPLICATIONS

- Cordless/Cellular/GSM/PHS Telephones
- Personal Data Assistants
- Personal Communicators
- Palmtop Computers
- GPS
- Pagers

Always order by complete part number, e.g., **A8405SLH-xx**, where "xx" is the required output voltage in tenths or "ADJ" for adjustable.

8405 LOW-DROPOUT REGULATORS

FUNCTIONAL BLOCK DIAGRAM

Dwg. FS-012-7

A8405SLH Maximum Allowable Average Output Current* with device mounted on 2.24" x 2.24" (56.9 mm x 56.9 mm) solder-coated copper-clad board in still air.

T_A	Allowable Total Average (10 ms) Output Current in Milliamperes with $T_J = 150^\circ\text{C}$, Duty Cycle = 100%†								
	0.5	1.0	1.5	2.0	2.5	3.0	3.5	4.0*	4.5*
25°C	200	200	200	200	200	189	162	142	126
50°C	200	200	200	200	182	152	130	114	101
70°C	200	200	200	182	145	121	104	91	81
85°C	200	200	197	148	118	98	84	74	66

* Absolute maximum peak output current rating is 200 mA; absolute maximum input voltage is 7 V.

† $I_O = (T_J - T_A) / ([V_I - V_O] R_{\theta JA} \times dc) = (150 - T_A) / ([V_I - V_O] \times 220 \times 1.00)$

Output current rating can be increased (to 200 mA maximum) by additional heat sinking or reducing the duty cycle.

ADJUST Input Current	I_{ADJ}	A8405SLH-ADJ only	—	0.10	—	μA
Rejection Ratio	PSRR	$V_I = V_{O(\text{nom})} + 1.5\text{ V}$, $V_i = 100\text{ mV}$, $I_O = 30\text{ mA}$, $f = 60\text{ Hz}$	—	70	—	dB
Output Noise	e_n	$10\text{ Hz} \leq f \leq 100\text{ kHz}$, $I_O = 10\text{ mA}$, $C_O = 10\text{ }\mu\text{F}$	—	0.2	—	$\mu\text{V}/\sqrt{\text{Hz}}$
Thermal Shutdown	T_J		—	170	—	°C

Typical values are at $T_A = +25^\circ\text{C}$ and are given for circuit design information only.

* Pulse test ($\leq 20\text{ ms}$). See previous page for duty cycle limitations.

8405 LOW-DROPOUT REGULATORS

APPLICATIONS INFORMATION

Linear regulators require input and output capacitors in order to maintain over-all loop stability. The recommended minimum value for the input capacitor is 0.1 μF . The output capacitor is the dominant pole that provides the high-frequency compensation required for over-all regulator loop stability. These devices are stable with as little as 1 μF . However, to ensure stable operation under all conditions and capacitor types, the recommended minimum value is 4.7 μF . The output capacitor may be partially distributed through the load circuits. However, at least 1 μF should be connected at the regulator using the shortest and widest foil pattern possible.

The A8405SLH-ADJ requires an external voltage divider to set up the desired regulated output voltage between 2.0 V and 6.8 V ($V_1 \leq 7$ V). The two resistors are chosen such that

$$V_O = 1.26 (R_1 + R_2)/R_2.$$

The resistor values are usually as high as possible to maintain high circuit efficiency, but R2 should be less than 300 k Ω .

Thermal Considerations

These devices are intended to provide more than 150 mA of continuous current in a very small package. The table on page 2 of this data sheet gives the maximum allowable average output current for a worst-case printed circuit design ($R_{\theta JA} = 220^\circ\text{C}/\text{W}$ with a minimum footprint). Performance improvement is easily accomplished with the addition of 1 square inch of copper at terminal 2 ($R_{\theta JA} = 170^\circ\text{C}/\text{W}$).

8405 LOW-DROPOUT REGULATORS

Dimensions in Inches (for reference only)

Dimensions in Millimeters (controlling dimensions)

- NOTES:
1. Tolerances on package height and width represent allowable mold offsets. Dimensions given are measured at the widest point (parting line).
 2. Exact body and lead configuration at vendor's option within limits shown.
 3. Height does not include mold gate flash.
 4. Where no tolerance is specified, dimension is nominal.
