

# FAN7527

## Power Factor Correction Controller

### Features

- Internal Startup Timer
- Internal R/C filter eliminates the Need for an External R/C filter
- Very Precise Adjustable Output Over Voltage Protection
- Zero Current Detector
- One Quadrant Multiplier
- Trimmed 1.5% Internal Bandgap Reference
- Under Voltage Lock Out with 3V of Hysteresis
- Totem Pole Output with High State Clamp
- Low Startup and Operating Current
- 8-Pin DIP or 8-Pin SOP

### Applications

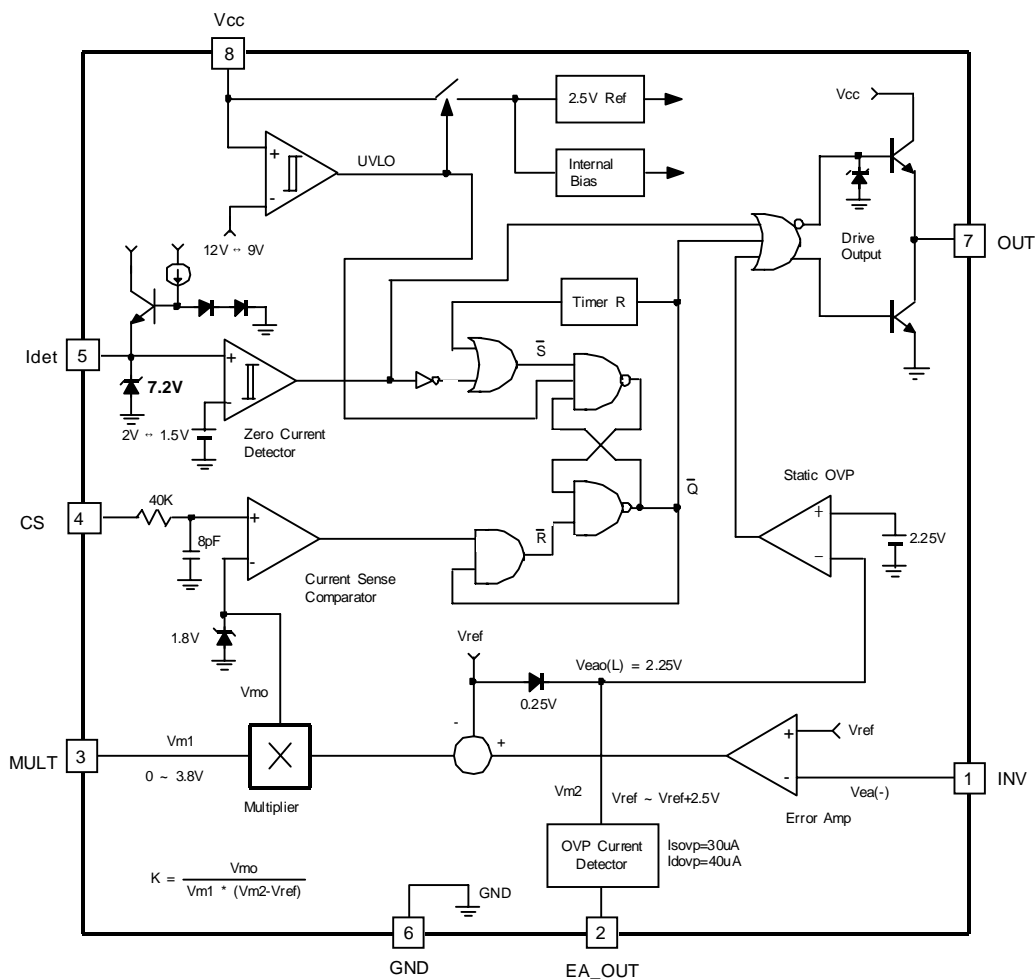

- Electronic Ballast
- SMPS

### Description

The FAN7527 provides simple and high performance active power factor correction. FAN7527 is optimized for electronic ballast and low power, high density power supplies which require minimum board area reduced component count and low power dissipation. Internal R/C filter eliminates the need for an external R/C filter. Internally clamping the error amplifier and multiplier outputs, improves turn on overshoot characteristics and current limiting. Special circuitry has also been added to prevent no load runaway conditions. Independent of supply voltage, the output drive clamping circuit limits overshoot of the power MOSFET gate drive. This greatly enhances the system reliability.

## PIN Description

Pin Number	Pin Name	Pin Function Description
1	INV	Inverting input of the error amplifier. The output of the boost converter should be resistively divided to 2.5V and connected to this pin.
2	EA_OUT	The output of the error amplifier. A feedback compensation network is placed between this pin and the INV pin.
3	MULT	Input to the multiplier stage. The full-wave rectified AC is divided to less than 2V and is connected to this pin.
4	CS	Input to the PWM comparator. Current is sensed in the boost stage MOSFET by a resistor in the source lead. An internal leading edge blanking circuitry has been included to reject any high frequency noise present on the current waveform.
5	Idet	The zero current detector senses the inductor current by monitoring when the boost inductor auxiliary winding voltage falls below 1.8V. If it is connected to GND, the device is disabled.
6	GND	The ground potential of all the pins.
7	OUT	Gate driver output . A push pull output stage is able to drive the Power MOSFET with peak current of 400mA.
8	Vcc	Supply voltage of driver and control circuits.
