SL532

LOW PHASE SHIFT LIMITER

The SL532C is a monolithic integrated circuit designed for use in wideband limiting IF strips. It offers a bandwidth of over 400MHz and very low phase shift with amplitude. The small signal gain is 12dB and the limited output is 1V peak to peak. The use of a 5GHz IC process has produced a circuit which gives less than 1° phase shift when overdriven by 12dB. The amplifier has internal decoupling capacitors to ease the construction of cascaded strips and the number of external components required has been minimised.

The device is also available as the DES9052101/AC/CMAR which has guaranteed operation over the full Military Temperature Range and is screened in accordance with the DESC approved Standardised Military Drawing Data is available separately.

CIRCUIT DESCRIPTION

The SL532 uses a long-tailed pair limiting amplifier which combines low phase shift with a symmetrical limiting characteristic. This is followed by a simple emitter follower output stage. Each stage of a strip is capable of driving to full output a succeeding SL532 but a buffer amplifier is needed to drive lower impedance loads. No external decoupling capacitors are normally required but for use below 10MHz extra decoupling can be added on pins 1 and 5. Bias for the long-tailed pair is provided by connecting the bias (pin 2) to the decoupled supply (pin 1).
