CXP913P048

CMOS 16-bit Single Chip Microcomputer

Description

The CXP913P048 is a CMOS 16-bit microcomputer integrating on a single chip an A/D converter, serial interface with an incorporated buffer RAM, high-precision timing pattern generation function, pulse cycle measurement circuit, PWM generator, general-purpose prescaler, vertical sync separation circuit, and a measurement circuit which measures the signals of capstan FG, drum FG/PG, reel FG and other servo systems with high precision, as well as basic configurations like a 16-bit CPU, ROM, RAM, and I/O port.

This LSI also provides sleep/stop modes that enable lower power consumption.

The CXP913P048 is the PROM-incorporated version of the CXP913040 with built-in mask ROM. This provides the additional feature of being able to write directly into the program. Thus, it is most suitable for evaluation use during system development and for small-quantity production.
