

AN7535NSA

Headphone amplifier IC for portable equipment

Overview

The AN7535NSA is an audio signal processing IC in which line amplifiers and beep circuit are built in the headphone amplifiers for use in portable equipment. Its headphone output block is using the center amplifier method which eliminates the need for coupling capacitor so that the circuit is most suitable for rationalization of audio circuit.

Features

- Output coupling capacitor is not required (Center amplifier method)
- Built-in line amplifiers
- Built-in headphone amplifier gain change-over circuit (8 dB/12 dB)
- Built-in mute circuit
- Built-in beep circuit
- Built-in circuit against a shock noise generated when power supply is momentary cut off.

Applications

- Potable CD and MD players, etc.

■ Usage Notes

1. Use N.C. pin in open or grounded condition.
2. The output middle point of line amplifier is determined by the following equation ;
Depending on the values of V_{CC} and $V_{CC-LINE}$, the middle point of line amplifier may shift from $1/2V_{CC-LINE}$.
Use it by conducting a fine adjustment of R_1 and R_2 .

$$V_{O-DC} = V_{CC} \frac{25}{30} \cdot 1.1 \cdot \frac{R_1}{R_1 + R_2}$$

3. It is recommended that the V_{CC} (pin 3) should be used at the same potential of the $V_{CC-LINE}$ (pin 10), or 0.2 V lower than the potential of $V_{CC-LINE}$ (pin 10).
