

## 74FR900 9-Bit, 3-Port Latchable Datapath Multiplexer

### General Description

The 74FR900 is a data bus multiplexer routing any of three 9-bit ports to any other one of the three ports. Readback of data latched from any port onto itself is also possible. The 74FR900 maintains separate control of all latch-enable, output enable and select inputs for maximum flexibility. PINV allows inversion of the data from the  $C_8$  to  $A_8$  or  $B_8$  path. This is useful for control of the parity bit in systems diagnostics.

Fairchild's 74FR25900 includes 25Ω resistors in series with port A and B outputs. Resistors minimize undershoot and ringing which may damage or corrupt sensitive device inputs driven by these ports.

### Features

- 9-bit data ports for systems carrying parity bits
- Readback capability for system self checks.
- Independent control lines for maximum flexibility
- Guaranteed multiple output switching and 250 pF load delays
- Outputs optimized for dynamic bus drive capability
- PINV parity control facilitates system diagnostics
- FR25900 resistor option for driving MOS inputs such as DRAM arrays

### Ordering Code:

Order Number	Package Number	Package Description
74FR900SSC	MS48A	48-Lead Small Shrink Outline Package (SSOP), JEDEC MO-118, 0.300 Wide

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

### Logic Symbol

### Connection Diagram

### Pin Description

Pin Names	Description
$\overline{LE}_{xx}$	Latch Enable Inputs
$OE_x$	Output Enable Inputs
PINV	Parity Invert Input
$S_0, S_1$	Select Inputs
$A_0-A_8$	Port A Inputs or 3-STATE Outputs
$B_0-B_8$	Port B Inputs or 3-STATE Outputs
$C_0-C_8$	Port C Inputs or 3-STATE Outputs

## Functional Description

The 74FR900 allows 9-bit data to be transferred from any of three 9-bit I/O ports to either of the two remaining I/O ports. The device employs latches in all paths for either transparent or synchronous operation. Readback capability from any port to itself is also possible.

Data transfer within the 74FR900 is controlled through use of the select ( $S_0$  and  $S_1$ ) and output-enable ( $\overline{OE}_A$ ,  $\overline{OE}_B$  and  $\overline{OE}_C$ ) inputs as described in Table 1. Additional control is available by use of the latch-enable inputs ( $\overline{LEAC}$ ,  $\overline{LECA}$ ,  $\overline{LEBC}$ ,  $\overline{LECB}$ ) allowing either synchronous or transparent transfers (see Table 2). Table 1 indicates several readback conditions. By latching data on a given port and initiating the readback control configuration, previous data may be read for system verification or diagnostics. This mode may be useful in implementing system diagnostics.

Data at the port to be readback must be latched prior to enabling the outputs on that port. If this is not done, a closed data loop will result causing possible data integrity problems. Note that the A and B ports allow readback without affecting any other port. Port C, however, requires interruption of either port A or B to complete its readback path.

PINV controls inversion of the  $C_8$  bit. A low on PINV allows  $C_8$  data to pass unaltered. A high causes inversion of the data. See Table 3. This feature allows forcing of parity errors for use in system diagnostics. This is particularly helpful in 486 processor designs as the 486 does not provide odd/even parity selection internally.

TABLE 1. Datapath Control

Inputs					Function
$S_0$	$S_1$	$\overline{OE}_A$	$\overline{OE}_B$	$\overline{OE}_C$	
L	X	H	L	L	Port A to Port C
L	L	H	H	H	Port A to Port B
L	O	H	H	L	Port A to B+C
H	L	L	L	H	Port B to Port A
H	X	H	L	L	Port B to Port C
H	O	L	L	L	Port B to A+C
X	H	L	L	H	Port C to Port A
X	H	H	H	H	Port C to Port B
X	H	L	H	H	Port C to A+B
X	X	H	L	H	Outputs Disabled
L	L	L	X	X	(Readback to A) (Note 1)
L	H	L	X	L	(Readback to A or C) (Note 1)
H	L	X	H	X	(Readback to B) (Note 1)
H	H	X	H	L	(Readback to B or C) (Note 1)

Note 1: Readback operation in latched mode only. Transparent operation could result in unpredictable results.

TABLE 2. Latch-Enable Control

$\overline{LE}_{xx}$	Input	Output
L	L	L
L	H	H
H	X	$Q_0$

L = LOW Voltage

H = HIGH Voltage Level

TABLE 3. PINV Control

PINV	$C_8$	$A_8$ or $B_8$
L	L	L
L	H	H
H	L	H
H	H	L

$Q_0$  = Output state prior to  $\overline{LE}_{xx}$  LOW-to-HIGH transition

## Logic Diagram

**Absolute Maximum Ratings** (Note 2)

Storage Temperature	-65°C to +150°C
Ambient Temperature under Bias	-55°C to +125°C
Junction Temperature under Bias	-55°C to +150°C
V <sub>CC</sub> Pin Potential to Ground Pin	-0.5V to +7.0V
Input Voltage (Note 3)	-0.5V to +7.0V
Input Current (Note 3)	-30 mA to +5.0 mA
Voltage Applied to Output in HIGH State (with V <sub>CC</sub> = 0V)	
Standard Output	-0.5V to V <sub>CC</sub>
3-STATE Output	-0.5V to +5.5V
Current Applied to Output in LOW State (Max)	twice the rated I <sub>OL</sub> (mA)
ESD Last Passing Voltage (Min)	4000V

**Recommended Operating Conditions**

Free Air Ambient Temperature	0°C to +70°C
Supply Voltage	+4.5V to +5.5V

**Note 2:** Absolute maximum ratings are values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

**Note 3:** Either voltage limit or current limit is sufficient to protect inputs.

**DC Electrical Characteristics**

Symbol	Parameter	Min	Typ	Max	Units	V <sub>CC</sub>	Conditions
V <sub>IH</sub>	Input HIGH Voltage	2.0			V		Recognized HIGH Signal
V <sub>IL</sub>	Input LOW Voltage			0.8	V		Recognized LOW Signal

**Note 5:** This specification is guaranteed but not tested. The limits apply to propagation delays for all paths described switching in phase, i.e., all LOW-to-HIGH, HIGH-to-LOW, 3-STATE-to-HIGH, etc.

**Note 6:** This specification is guaranteed but not tested. The limits represent propagation delays with 250 pF load capacitors in place of the 50 pF load capacitors standard AC load. This specification pertains to single output switching only.

Fairchild does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and Fairchild reserves the right at any time without notice to change said circuitry and specifications.

**LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
