Synchronizing dual J-K positive edge-triggered flip-flop with metastable immune characteristics

74F50109

FEATURE

- Metastable immune characteristics
- Output skew guaranteed less than 1.5ns
- High source current ($I_{OH} = 15\text{mA}$) ideal for clock driver applications
- Pinout compatible with 74F109
- See 74F5074 for synchronizing dual D-type flip-flop
- See 74F50728 for synchronizing cascaded D-type flip-flop
- See 74F50729 for synchronizing dual D-type flip-flop with edge-triggered set and reset

TYPE	TYPICAL f_{max}	TYPICAL SUPPLY CURRENT(TOTAL)

LOGIC DIAGRAM

DESCRIPTION

The 74F50109 is a dual positive edge-triggered JK-type flip-flop featuring individual J, K, clock, set, and reset inputs; also true and complementary outputs.

Set (\overline{SD}) and reset (\overline{RD}) are asynchronous active low inputs and operate independently of the clock (CP) input.

The J and K are edge-triggered inputs which control the state changes of the flip-flops as described in the function table. The J and K inputs must be stable just one setup time prior to the low-to-high transition of the clock for guaranteed propagation delays. The JK design allows operation as a D flip-flop by tying J and K inputs together.

The 74F50109 is designed so that the outputs can never display a metastable state due to setup and hold time violations. If setup time and hold time are violated the propagation delays may be extended beyond the specifications but the outputs will not glitch or display a metastable state. Typical metastability parameters for the 74F50109 are: $\tau \approx 135\text{ps}$ and $\tau \approx 9.8 \times 10^6 \text{ sec}$ where τ represents a function of the rate at which a latch in a metastable state resolves that condition and T_0 represents a function of the measurement of the propensity of a latch to enter a metastable state.

METASTABLE IMMUNE CHARACTERISTICS

Philips Semiconductors uses the term 'metastable immune' to describe characteristics of some of the products in its FAST family. Specifically the 74F50XXX family presently consist of 4 products which displays metastable immune characteristics. This term means that the outputs will not glitch or display an output anomaly under any circumstances including setup and hold time violations.

This claim is easily verified on the 74F5074. By running two independent signal generators (see Fig. 1) at nearly the same frequency (in this case 10MHz clock and 10.02 MHz data) the

device-under-test can often be driven into a metastable state. If the Q output is then used to trigger a digital scope set to infinite persistence the \overline{Q} output will build a waveform. An experiment was run by continuously operating the devices in the region where metastability will occur.

When the device-under-test is a 74F74 (which was not designed with metastable immune characteristics) the waveform will appear as in Fig. 2.

Fig. 2 shows clearly that the \overline{Q} output can vary in time with respect to the Q trigger point. This also implies that the Q or \overline{Q} output waveshapes may be distorted. This can be verified on an analog scope with a charge plate CRT. Perhaps of even greater interest are the dots running along the 3.5V volt line in the upper right hand quadrant. These show that the \overline{Q} output did not change state even though the Q output glitched to at least 1.5 volts, the trigger point of the scope.

When the device-under-test is a metastable immune part, such as the 74F5074, the waveform will appear as in Fig. 3. The 74F5074 \overline{Q} output will appear as in Fig. 3. The 74F5074 Q output will not vary with respect to the Q trigger point even when the a part is driven into a metastable state. Any tendency towards internal metastability is resolved by Philips Semiconductors patented circuitry. If a metastable event occurs within the flop the only outward manifestation of the event will be an increased clock-to-Q/ \overline{Q} propagation delay. This propagation delay is, of course, a function of the metastability characteristics of the part defined by τ and T_0 .

The metastability characteristics of the 74F5074 and related part types represent state-of-the-art TTL technology.

After determining the T_0 and t of the flop, calculating the mean time between failures (MTBF) is simple. Suppose a designer wants to use the 74F50729 for synchronizing asynchronous data that is arriving at 10MHz (as measured by a frequency counter), has a clock frequency of 50MHz, and has decided that he would like to sample the output of the 74F50109 10 nanoseconds after the clock edge. He simply plugs his number into the equation below:

$$\text{MTBF} = e^{(t'/t)} / T_0 f_c f_i$$

In this formula, f_c is the frequency of the clock, f_i is the average input event frequency, and t' is the time after the clock pulse that the output is sampled ($t' < h$, h being the normal propagation delay). In this situation the f_i will be twice the data frequency of 20 MHz because input events consist of both of low and high transitions. Multiplying f_i by f_c gives an answer of 10^{15} Hz^2 . From Fig. 4 it is clear that the MTBF is greater than 10^{10} seconds. Using the above formula MTBF is 1.51×10^{10} seconds or about 480 years.

FUNCTION TABLE

INPUTS					OUTPUTS		OPERATING MODE
\overline{SD}	\overline{RD}	CP	J	\overline{K}	Q	\overline{Q}	
L	H	X	X	X	H	L	Asynchronous set
H	L	X	X	X	L	H	Asynchronous reset
L	L	X	X	X	H	H	Undetermined*
H	H	\uparrow	X	X	q	\overline{q}	Hold
H	H	\uparrow	h	l	\overline{q}	q	Toggle
H	H	\uparrow	h	h	H	L	Load "1" (set)
H	H	\uparrow	l	l	L	H	Load "0" (reset)
H	H	\uparrow	l	h	q	\overline{q}	Hold 'no change'

NOTES:

- H = High-voltage level
- h = High-voltage level one setup time prior to low-to-high clock transition
- L = Low-voltage level
- l = Low-voltage level one setup time prior to low-to-high clock transition
- q = Lower case indicate the state of the referenced output prior to the low-to-high clock transition
- X = Don't care
- \uparrow = Low-to-high clock transition
- \uparrow = Not low-to-high clock transition
- * = Both outputs will be high if both \overline{SD} and \overline{RD} go low simultaneously

ABSOLUTE MAXIMUM RATINGS

(Operation beyond the limit set forth in this table may impair the useful life of the device. Unless otherwise noted these limits are over the operating free air temperature range.)

SYMBOL	PARAMETER	RATING	UNIT
V _{CC}	Supply voltage	-0.5 to +7.0	V
V _{IN}	Input voltage	-0.5 to +7.0	V
I _{IN}	Input current	-30 to +5	mA
V _{OUT}	Voltage applied to output in high output state	-0.5 to V _{CC}	V
I _{OUT}	Current applied to output in low output state	40	mA
T _{amb}	Operating free air temperature range	0 to +70	°C
T _{stg}	Storage temperature range	-65 to +150	°C

RECOMMENDED OPERATING CONDITIONS

SYMBOL	PARAMETER	LIMITS			UNIT
		MIN	NOM	MAX	
V _{CC}	Supply voltage	4.5	5.0	5.5	V
V _{IH}	High-level input voltage	2.0			V
V _{IL}	Low-level input voltage			0.8	V
I _{IK}	Input clamp current			-18	mA
I _{OH}	High-level output current			-1	mA
I _{OL}	Low-level output current			20	mA
T _{amb}	Operating free air temperature range	0		+70	°C

DC ELECTRICAL CHARACTERISTICS

(Over recommended operating free-air temperature range unless otherwise noted.)

SYMBOL	PARAMETER	TEST CONDITIONS ¹		LIMITS			UNIT	
				MIN	TYP ²	MAX		
V _{OH}	High-level output voltage	V _{CC} = MIN, V _{IL} = MAX, V _{IH} = MIN	I _{OH} = MAX	±10%V _{CC}	2.5		V	
				±5%V _{CC}	2.7	3.4	V	
V _{OL}	Low-level output voltage	V _{CC} = MIN, V _{IL} = MAX, V _{IH} = MIN	I _{OL} = MAX	±10%V _{CC}		0.30	0.50	V
				±5%V _{CC}		0.30	0.50	V
V _{IK}	Input clamp voltage	V _{CC} = MIN, I _I = I _{IK}			-0.73	-1.2	V	
I _I	Input current at maximum input voltage	V _{CC} = MAX, V _I = 7.0V				100	μA	
I _{IH}	High-level input current	V _{CC} = MAX, V _I = 2.7V				20	μA	
I _{IL}	Low-level input current	J _n , \bar{K} _n	V _{CC} = MAX, V _I = 0.5V			-250	μA	
		CP _n , \bar{S} D _n , \bar{R} D _n	V _{CC} = MAX, V _I = 0.5V			-20	μA	
I _{OS}	Short circuit output current ³	V _{CC} = MAX			-60	-150	mA	
I _{CC}	Supply current ⁴ (total)	V _{CC} = MAX			22	32	mA	

NOTES:

- For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable type.
- All typical values are at V_{CC} = 5V, T_{amb} = 25°C.
- Not more than one output should be shorted at a time. For testing I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
- Measure I_{CC} with the clock input grounded and all outputs open, then with Q and \bar{Q} outputs high in turn.

Definitions

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Disclaimers

Life support — These products are not designed for use in life support appliances, devices or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes, without notice, in the products, including circuits, standard cells, and/or software, described or contained herein in order to improve design and/or performance. Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no license or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.
