Complementary NPN-PNP Silicon Power Bipolar Transistor

- The MJL3281A and MJL1302A are PowerBase power transistors for high power audio, disk head positioners and other linear applications.
- Designed for 100 W Audio Frequency
- Gain Complementary:
 - Gain Linearity from 100 mA to 7 A
 - High Gain — 60 to 175
 - $h_{FE} = 45$ (Min) @ $I_C = 8$ A
- Low Harmonic Distortion
- High Safe Operation Area — 1 A/100 V @ 1 sec
- High f_T — 30 MHz Typical

Designer's Data for "Worst Case" Conditions — The Designer's Data Sheet permits the design of most circuits entirely from the information presented. SOA Limit curves — representing boundaries on device characteristics — are given to facilitate "worst case" design.

Figure 11. Forward Bias Safe Operating Area (FBSOA)

There are two limitations on the power handling ability of a transistor; average junction temperature and secondary breakdown. Safe operating area curves indicate $I_C - V_{CE}$ limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure 11 is based on $T_{J(pk)} = 200^\circ\text{C}$; T_C is variable depending on conditions. At high case temperatures, thermal limitations will reduce the power than can be handled to values less than the limitations imposed by second breakdown.
