

## Solenoid and Motor Driver (1/2 H Driver)

April 1992

### Features

- Chip Encapsulated in a 5-Lead Plastic TO-220 Style Package (VERSA-VI)
- Output Short Circuit Protection
- Thermal Overload Protection
- Solenoid Inductive "Kick" Protection with Internal-Clamp Diodes
- Output Sink and Source Capacity of 600mA Minimum Overtemperature
- Horizontal and Vertical Mounting Packages Available
- Separate Sink Circuit and Source Circuit, Each Individually Controlled

### Applications

- Latching Solenoid Driver (Single and Multiple)
- Non-Latching Solenoid Driver
- Relay Driver
- Lamp Controller
- Lamp Driver
- Motor Controller (Forward and Reverse)
- Stepper Motor Controller
- On-Off Logic Controllers (TTL Logic)
- Intermediate Power Driver
- Triac, SCR, and Transistor Drivers

### Description

The CA3169 is a monolithic integrated circuit capable of driving lamps and other devices that can be changed between two states (on or off). Transistors, SCR's, and triacs are some of the solid state devices that can be controlled by the CA3169. This device can also control relays, solenoids (latching or nonlatching), motors (DC - forward and reverse) and DC stepping motors.

The CA3169 contains a separate source driver circuit with internal current limiting protection and a separate sink driver circuit. The sink driver contains an energy absorbing diode to protect the device against any inductive "kick" during state changes. The CA3169 is protected against overvoltage conditions on the output drivers and overtemperature conditions (thermal-shutdown protection).

The input operating levels are TTL compatible. The source and sink outputs are in their off condition (non-conducting) when their respective inputs are in a HI state, or open-circuited. The outputs are in their on state (conducting) when their respective inputs are LO. The VERSA-VI package is available with two lead configurations. The CA3169 has a vertical-mount lead form, and the CA3169M has a horizontal-mount lead form.

FIGURE 7. OVERVOLTAGE PROTECTION.

FIGURE 8. THERMAL SHUTDOWN.

PROCEDURE

1. Measure V12.
2. Increase VCC until V12 ≥ 2V.
3. Measure VCC; this voltage is the high trip point. Pin 2 should be off; i.e., pin 3 should be high.
4. Observe and measure the voltage at pin 3.
5. Decrease VCC until pin 3 switches, i.e., ≤ 18V. The supply voltage will be the low trip point voltage.

When VCC is turned on, IIN should be equal to or greater than 1A. Thermal shutdown will operate properly if the input current drops below 0.5A (0.3A typ.) in 10 to 15 seconds. Cover the unit during this test in the event that the thermal shutdown is not operating properly.

FIGURE 9. OUTPUT SATURATION VOLTAGE.

**Typical Applications**

When input A goes low, lamp A will light.  
When input B goes low, lamp B will light.

**FIGURE 10. LAMP DRIVER.**

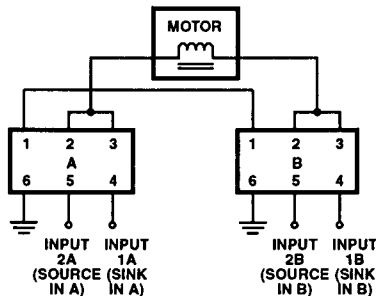

Input A and input B must both be low for the solenoid to switch.

**FIGURE 11. NON-LATCHING SOLENOID.**

Relay A will close when in input A goes low. Relay B will close when input B goes low. Both relays will close when both inputs go low.

**FIGURE 12. RELAY DRIVER.**

When opposing inputs go low, the motor will switch direction; if source input A and sink input B both go low, current will flow from A to B. If source input B and sink input A both go low, current will flow from B to A.
