General Description

The HV34 is a low voltage serial to high voltage parallel converter with push-pull outputs. This device has been designed for use as a printer driver for inkjet applications. It can also be used in any application requiring multiple output high voltage, low current sourcing and sinking capabilities.

The device consists of a 64-bit shift register, 64 latches, and control logic to perform the polarity select and blanking of the outputs. A DIR pin controls the direction of data shift through the device. With DIR grounded, D_{IOA} is Data-In and D_{IOB} is Data-Out; data is shifted from HV_{OUT64} to HV_{OUT1} . When DIR is at logic high, D_{IOB} is Data-In and D_{IOA} is Data-Out; data is then shifted from HV_{OUT1} to HV_{OUT64} . Data is shifted through the shift register on the low to high transition of the clock. Data output buffers are provided for cascading devices. Operation of the shift register is not affected by the \overline{LE} (latch enable), \overline{BL} (blinking), or the \overline{POL} (polarity) inputs. Transfer of data from the shift register to the latch occurs when the \overline{LE} (latch enable) is high. The data in the latch is stored during \overline{LE} transition from high to low.

Notes:

1. All voltages are referenced to GND.
2. Connection to all power and ground pads is required. Duty cycle is limited by the total power dissipated in the package.
3. For operation above 25°C ambient derate linearly to maximum operating temperature at 20mW/°C for plastic and at 31.7mW/°C for ceramic.

- Apply V_{PP} .
- The V_{PP} should not drop below V_{DD} or float during operation.

Power-down sequence should be the reverse of the above.
